V 1.0.0

(12) TCORF Quick Start Guide

(Onboarding + Optional AI Evaluation)

Table of Contents

1. Choose Your Path 2
2. Safety & Reliability Notes (Read First) 5
3. How to Use AI Tools (Step-by-Step) 8
4. Appendix: Prompt Library (Optional) 9

Prompts for 5-Minute AI-Assisted Quick Evaluation 10

A. The "Tech Journalist" Prompt 10

B. The "Youtuber and Patreon creator" Prompt 10

C. The "Citizen" Prompt 10

D. The "Competitive Debater" Prompt 10

Rights Finder: AI Prompt Templates 10

A. “Environmental Risk” Prompt Template 10

B. “Rising HOA Fees” Prompt Template 10

Real-World Interaction: Shadow Audit (AI Prompt for a Specific Issue) 10

“Rising HOA Fees” (Shadow Audit) 10

C. “Rising Water Utility Fees” Prompt Template 10

D. “Climate Policy” Prompt Template 10

E. “Fiscal Instability” Prompt Template 10

Public Figures: Two Prompts Built on Right 17 11

A. The "Debt and Population" (4-Denominator) Prompt 11

B. The "Tax Catalogue" Prompt 11

Organization Trees: Two Prompts as a Pre-Step to Right 16 12

1. Choose Your Path

Three paths. Each time is a ceiling for a common reader. All three end at the same safety gate.

Use 2 AI tools, at least for your first prompt. Quality and speed vary a lot between them, and the only way to see how yours handles this material is to give the same prompt to 2 tools and compare the answers. After that, carry on in the one you prefer.

Expect the first prompt to take 1 to 5 minutes. If 1 tool is still working well past that while the other has answered, you have your answer about which to use — a tool that struggles with 15 PDFs on the first prompt will struggle on all of them. The 2 figure prompts at the end of the Appendix are the exception: they search the open web, and that is slow regardless of the tool.

Path	Time	What you do	What you get
Quick evaluation	Up to 5 minutes	1 evaluation prompt	A second opinion on whether TCORF is worth your time
Closer look — recommended	Up to 30 minutes	The Rights that match your situation, or the prompts	Working knowledge of the Rights you actually need
Full orientation	Up to 4 hours	The intro set, 2 categories in detail, the operational documents	A view of the whole framework

We do not recommend learning the whole framework at once. The 30-minute path is the one most Owners should take: narrow the focus to the Rights that affect you, and the time investment stays small while the usefulness does not.

Neither the 30-minute nor the 4-hour path reads Documents 31 and 32 end to end. They are 45+ pages and they are look-up documents. You open the Rights you need.

Up to 5 minutes — Quick evaluation

Run 1 of the evaluation prompts in the Appendix. Read the output. Decide whether to continue.

Up to 30 minutes — Closer look

Assumes you have run a 5-minute evaluation or read the README. It starts at the Rights, not at the concepts. Take path A or path B.

A — Reading

- 5 minutes — Document 20: scan the 39 titles, mark 1 to 4. Read their short descriptions in Document 30.
- 10 minutes — read those entries in full in Document 31.
- 10 minutes — if any of them carries an extension, scan it in Document 32.
- 5 minutes — Document 53, Section 4: the safety gate

B — Prompts

- 25 minutes — run the copy-and-paste prompts in the Appendix, or write your own. The evaluation prompts and the Rights Finder templates are quick; the 2 figure prompts take most of the 25 minutes on their own. Where a prompt names a Right, open it in Document 31 and read the wording yourself.
- 5 minutes — Document 53, Section 4: the safety gate. Decide whether anything should be filed at all.

Path B is a way into path A, not a substitute for it. An AI's description of a Right is navigation. The Right is what Document 31 says.

Up to 4 hours — Full orientation

This does not have to be 1 sitting. Four 1-hour sessions, taken whenever you have time, work as well. Take path A or path B.

A — Reading

- 45 minutes — the intro set: README, Documents 00, 10, 11, 12, 20 and 30.
- 45 minutes — 2 categories of Rights in full in Document 31.
- 30 minutes — 4 to 6 further Rights from other categories, chosen by what affects you.
- 15 minutes — scan the extensions in Document 32 for whichever of those carry one.
- 20 minutes — Documents 40 and 41: how a request is handled, and how the framework sits against law.
- 0 to 10 minutes — skim Documents 51 and 52. Skip them if you are only auditing for yourself. They are mostly relevant, if you will publish anything about the framework or if you are acting for an organization.
- 15 minutes — Document 53, Section 4: the safety gate.
- 60 minutes — whatever is left: the rest of the documents, or write your own prompts.

B — AI-assisted

- 30 minutes — read the README and Documents 10, 12 and 20 yourself, so you know what you are querying.
- 90 minutes — run the prompts in thinking mode: the SSR prompt from the README, the evaluation prompts, and the 2 figure prompts. Optionally write your own prompts.
- 45 minutes — select 1 to 4 Rights from Document 20, read their short descriptions in Document 30, then read those entries in full in Document 31, and their extensions in Document 32 if they carry one.
- 15 minutes — Document 53, Section 4: the safety gate.
- 60 minutes — whatever is left: the other documents, or more prompts of your own.

The last block in both paths is also slack. Anything that ran long comes out of it, which is what keeps 4 hours a ceiling.

2. Safety & Reliability Notes (Read First)

Safety note (required):

Before using TCORF in a real-world situation, read **Document 53 (Disclaimer)[REF:D53]** and assess whether your environment is safe for escalation.

AI reliability note (important):

AI tools can produce convincing errors—especially when documents are missing, context is incomplete, or the model summarizes instead of quoting. Use AI output as **navigation only**

In any conflict between an AI's summary and the text of the original PDF documents, the Original Documentation is the sole authoritative source. Owners must verify the final wording of a Right in the "Framework" (Document 31) [REF:D31] before initiating a formal Remediation Request.

Please **avoid providing files in prompts as URLs (or as a ZIP file)**; it can increase the risk of inaccurate AI output.

AI Safety Warning (TCORF use):

If you believe your AI prompts could be used against you (now or later), **do not use AI** for anything related to your situation. If you still use AI, treat it like a public channel:

- **Never share** names, addresses, IDs, case numbers, screenshots, letters, audio, or exact dates/locations.
- Use AI only for **general navigation** (e.g., "which TCORF right might apply?"), not evidence review.
- Prefer **local/offline** AI, or a provider with strong privacy controls.
- Enable **temporary/no-history mode** and disable **chat saving/training** if your AI platform offers those settings.
- Assume anything you submit could be stored, logged, leaked, or correlated.

AI-assisted onboarding can help you focus faster, especially if you are dealing with a specific real-world issue and don't want to read all 39 rights immediately.

That said, AI tools vary in accuracy. Treat the AI as a **research assistant**—not a legal authority or final decision-maker.

Accuracy note for prompts that produce figures (read before running them)

Some prompts in this document do not ask an AI about TCORF. They send it to find figures about a jurisdiction — debt, population, tax rates. The rule above does not cover that.

For a question about the framework, the authority is the original documentation and you can check the answer in Document 31. For a figure about a jurisdiction there is no TCORF original. The authority is the Organization's own publication, which TCORF does not hold. The only check is to open the source named beside the figure.

Treat every such output as unverified until you do. Do not quote it, publish it, or repeat it as a fact about a country. A wrong figure presented as fact is a false claim about that country, and it discredits you and the framework before it reaches anyone else.

These prompts name a country, and a figure attached to a country is read as a claim about that country rather than as a test result. Expect it to be taken as a judgment, to travel further than you meant it to, and to be set against other countries in ways the figures do not support.

Think before you publish one, and think harder where the country is your own. Running the prompt is private and stays inside Shadow Audit. Publishing the result is engagement, and the safety rules in Document 53, Section 4, apply to that step rather than to the run.

Expect variation. The same prompt run twice, or run on 2 AI tools, will not return the same gaps. A blank means that run did not find a figure. It is not evidence that the figure is concealed, and it is not evidence of anything.

Some AI tools will fill a gap with a plausible invented figure rather than leave it blank. This is the main reason to run these prompts on 2 tools and compare.

No status, no guarantee, no onward use

The prompt is part of TCORF. The output is not. The Producer wrote the question; an AI tool you chose wrote the answer. No figure it returns has been checked, validated or endorsed by anyone, and none of it carries any TCORF status.

The Producer cannot see which tool you used, what it retrieved, what it skipped or what it invented, and has no way to find out. Document 53, Section 7, states this as a general condition. Here it is the specific reason no accuracy claim can be made about any number on your screen.

So do not carry the output further. Do not cite it, publish it, build on it, aggregate it with other runs, or present it as a TCORF result, a Document 32 finding, or a basis for a request under Document 40.

This is not a bar on the work itself. Open the source named beside a figure, confirm it, and record what you confirmed. That is your finding, made by you, and it stands on the source rather than on the prompt. What cannot travel is the unverified table.

3. How to Use AI Tools (Step-by-Step)

Use thinking or pro mode. Fast mode will answer, but it reads a long framework shallowly and produces confident, thin conclusions. You can use it; we do not propose it.

Step 1 — Choose tools that suit the material. Long document support, and a genuine reasoning mode.

Step 2 — Start a fresh chat. This removes context from earlier conversations.

Step 3 — Use the original PDF files. Download all 15 from the official source. If you have the ZIP archive, extract it first. Do not give the files as URLs or as a ZIP — both raise the risk of inaccurate output.

Step 4 — Upload all 15 PDFs. If your tool limits uploads, commonly to 10 files, upload in 2 batches and confirm all 15 are present before prompting.

Optionally Upload all 15 prompt files.

In that case you can ask AI to run prompt e.g. #00 from the uploaded files.
E.g. for #00 AI should run the prompt from the file **prompt_#00_R18_SSR.txt.**

Step 5 — Compare 2 tools on the first prompt, as described in Section 1, then carry on in the one you prefer.

Step 6 — Run 1 prompt at a time.

Step 7 — If you start a new session, re-upload all 15 PDFs.

4. Appendix: Prompt Library (Optional)

Why these prompts exist?

TCORF is long and new, so these prompts let you get an AI's assessment in minutes instead of reading every document.

Each prompt asks the AI to look for real usefulness for a specific role while demanding blunt criticism of flaws, risks and contradictions.

The goal is a candid second opinion, not a sales pitch.

They are examples, not the only way: we encourage you to write your own prompts around your own priorities, including openly skeptical ones.

AI can misread or overstate, so treat any output as a starting point and verify against the original documents.

How long they take

Expect 1 to 5 minutes for an evaluation prompt or a Rights Finder template. The 2 figure prompts at the end take longer: they search the open web, and that is slow regardless of the tool. Let a prompt finish before starting the next one.

Prompts for 5-Minute AI-Assisted Quick Evaluation

Use the four critical prompts (A–D) below to receive immediate and critical reviews. Select and copy all lines of the named file in one go and paste them directly into your AI tool and run it.

A. **The "Tech Journalist" Prompt**
   File: prompt_#01_Evaluation_POV_Tech_Journalist.txt
B. **The "Youtuber and Patreon creator" Prompt**
   File: prompt_#02_Evaluation_POV_Youtuber_and_Patreon_creator.txt
C. **The "Citizen" Prompt**
   File: prompt_#03_Evaluation_POV_Citizen.txt
D. **The "Competitive Debater" Prompt**
   File: prompt_#04_Evaluation_POV_Competitive_Debater.txt

Rights Finder: AI Prompt Templates

Select and copy all lines of the named file in one go and paste them directly into your AI tool and run it. There are templates easy to adjust to your personal interest.

A. **"Environmental Risk" Prompt Template**
   File: prompt_#05_Environmental_Risk.txt
   Expected output: mapping to **Right** 25 - at least
B. **"Rising HOA Fees" Prompt Template**
   File: prompt_#06_HOA_Fees.txt
   Expected output: mapping to Rights 12 and 26 - at least

Real-World Interaction: Shadow Audit (AI Prompt for a Specific Issue)

This section shows an example of a simulated real-world interaction ("Shadow Audit").

"Rising HOA Fees" (Shadow Audit)

File: prompt_#10_real_world.txt

C. **"Rising Water Utility Fees" Prompt Template**
   File: prompt_#07_Water Utility_Fees.txt
   Expected output: mapping to **Right** 26 - at least
D. **"Climate Policy" Prompt Template**
   File: prompt_#08_Climate.txt
   Expected output: mapping to **Right** 23 - at least
E. **"Fiscal Instability" Prompt Template**
   File: prompt_#09_Fiscal.txt
   Expected output: mapping to **Right** 16 - at least.

Public Figures: Two Prompts Built on Right 17

Web search must be on in your AI tool.

Runtime potentially between 3 and 20 minutes.

The 2 prompts do something different from the rest of this document. The evaluation prompts ask an AI what it thinks of TCORF. The Rights Finder templates ask which Rights fit a situation. These 2 produce figures about a jurisdiction you name — the figures Right 17 says an Organization ideally should publish about its own condition, drawn from [REF:D32-R17-EXT].

What to expect. The AI searches the public web and assembles what it finds. It does not read the Organization's own statistical release, and nothing it produces is an audit result, a TCORF finding, or a basis for a request under Document 40. It is orientation, and it stays inside Shadow Audit. Read the accuracy note in Section 2 before running either of these.

Expect blanks, and expect a lot of them. A jurisdiction with a strong statistics office returns a full debt series; most return gaps. The gaps are not a failure of the prompt. Where a figure that should exist is not published, or exists only by doing arithmetic the Organization never does, that absence is the whole point of Right 17.

A. The "Debt and Population" (4-Denominator) Prompt

5 years of public debt, divided by residents, citizens, taxpayers and citizen-taxpayers, beside 5 years of population figures. The division is the point: a total compares to nothing, and the 4 denominators show whether the burden rests on a narrower group than the headline suggests.

File: prompt_#11_R17_debt_and_population.txt

B. The "Tax Catalogue" Prompt

Every tax, levy, duty, tariff and mandatory charge at every level of government, marked by what sets it off — earning, buying, owning, transferring or using — plus the tax inside the price of fuel, food, electricity, gas and water. Expect it to be long, and expect holding charges you had not counted.

File: prompt_#12_R17_Tax_Catalogue.txt

Organization Trees: Two Prompts as a Pre-Step to Right 16

Web search must be on in your AI tool.

Runtime potentially between 3 and 20 minutes.

Right 16 asks what the Organization holds and owes. The extension in D32 [REF:D32-R16-EXT] cannot be applied to a country without first knowing which bodies belong to it — and most Owners cannot name 10. Public registers are split across a budget annex, an audit institution's auditee list, a holdings report and a company register, and in many jurisdictions no single register exists at all. That absence is itself a finding.

These 2 prompts assemble what can be found into 1 tree of names. No figures, no valuations, no assessment.

- **Prompt 13** takes 1 country or state and maps it downward as deep as the registers go.

  File: prompt_#13_R16_Country_State_Tree.txt

- **Prompt 14** takes 1 smaller entity — a city, a ministry, a state company — and does the same beneath it.

  File: prompt_#14_R16_Entity_Tree.txt

Both run entirely on public sources and need no TCORF document.

Before you use either. The output is assembled by an AI in a single run. Bodies and companies can be missing, merged, renamed, abolished, sold or invented, and holdings change without notice. A missing body means that run did not find it, not that the jurisdiction conceals it. How much is found varies by tool and by run, so a short list is a result about the run. Each prompt is capped at a fixed number of rows and will stop before a large Organization is complete. Expect a long run: this is dozens of web searches. Verify every entry at the source named beside it before relying on it, quoting it or publishing it. **The prompts are part of TCORF. Their output is not, and it carries no standing under this framework.**

DISCLAIMER: "53 TCORF Disclaimer.pdf" [REF:D53]
