(32) The citizens' / owners' rights framework, attachments

Not every Right needs the same amount of detail.

Some Rights are checked by something that either happened or did not. There is nothing to specify: you look at what took place, and the Right itself is already the whole test.

Other Rights ask an organization to publish information — a list, a set of figures, a record kept over time. These cannot be checked until someone says what the information should contain, how often it should be updated, and how long it should be kept. Without that, "published" can mean one page updated once.

Thirteen Rights therefore carry a technical extension in this document. The other twenty-six need none.

Operational Note: Users must strictly review the "Disclaimer" (Document 53) [REF:D53] regarding operational risk assessments and liability limitations prior to deployment.

Rights Classification Labels
TCORF Rights are labeled using two categories to improve clarity and adoption:

- **[AUDIT EFFECT]**: The Right is tested by what the Organization publishes and by how it handles a request: intake, registration, routing, preservation. The Owner records the result. The Right does not stop the action it describes.
- **[STOP CONDITION]** Everything under [AUDIT EFFECT], and in addition the Right's failure criteria name the act itself, not only the handling of a request.

Both categories are audit benchmarks, not legal entitlements.

Wherever this framework says "must", "shall", "required", "obligated" or "not acceptable", it states the benchmark the Organization's conduct is audited against. It creates no obligation, and a miss is recorded as a Finding, not enforced.

In an Active Audit, any real-world request must be grounded in applicable law, policy, contract, or stakeholder obligations—not in TCORF text alone.

On Numeric Thresholds
Where this framework specifies numeric thresholds (e.g., days, limits, quantities), these values are audit thresholds, not claims of optimal policy design. Numeric values are required to ensure measurability and comparability. Any threshold necessarily involves normative choice; the absence of a number would make compliance non-auditable. Each value is a bound set in the direction of stronger protection for the Owner. A minimum (notice periods, retention, history, coverage, floors) may be exceeded. A maximum (deadlines, response and publication lags, decree limits, tenure limits) may be undercut. Stricter protection always remains compliant.

13. Quality Assurance for Public Votes [AUDIT EFFECT]

Extension ID: D32-R13-EXT

Entry
Specifies what a public vote publishes and how its count is verified before the result carries the status final: the rules in force, the conditions, the roll and the field before the vote; the count and the check on the count after it.
Checks C1 to C4 and C6 to C9 can be run before the first voting day. The remainder require the count. The first set is what an Owner can see while a vote is still ahead of him.

How the count is checked. Not every ballot is recounted. A sample of count units is drawn and recounted independently, and the outcome is judged against a significance level fixed before the vote. The sample size is computed from that level and the reported margin: the closer the race, the larger the sample. The units are selected only after the figures are committed, so a unit cannot be prepared for inspection — the only way to pass reliably is for every unit to be right. Where the differences found lean predominantly one way, that is a signal on its own, whatever their size.

What this tells you about the result. The check does not ask how accurate the count was. It asks whether the winner is the winner.
That distinction is the method. An error of one ballot in a thousand can decide a race won by one in two thousand; an error of one in ten changes nothing in a landslide. So the question answered is not how many ballots were wrong, but whether enough were wrong to change who won — which is why the sample grows as the race tightens.
At a 5% significance level: if the announced winner were not the real winner, this check finds it at least 95 times in 100. When it passes, what can be said is that the error capable of changing the outcome was looked for, by a method that finds it almost always, and was not there.
What it does not say: that the count is 95% accurate; that errors are under 5%; that there is a 95% chance the winner won. It makes no claim about how many ballots were miscounted. Like any inspection, it can fail to find a wrong outcome — it never proves a count correct.

Where this comes from, and why 5%. A batch of medicine, a shipment of cement, a consignment at a border: none is accepted by inspecting every item. A sample is taken, and the level of certainty that sample must reach is agreed before it is taken. That agreed level is the significance level, and it has run industrial quality control and laboratory science for decades.
5% because it is the level science and industry already use by convention, so nobody has to be talked into a new number — and because this standard requires 5% **or better**, not exactly 5%. A jurisdiction choosing 1% is stricter and passes. Stricter is also cheaper than people expect: 1% needs about half again as many units as 5%, not several times as many. What really drives the cost is how close the race is — a knife-edge result costs many times what a comfortable one does, whichever level is chosen.

Why both halves are needed. A bold alteration needs few units, so a sample may miss it — but those units stand out against their neighbours on turnout and reconciliation, which are tested on every unit. A cautious alteration stays inside plausible variation, so the arithmetic misses it — but it needs many units, and the sample then finds it. Neither route is open.
These checks test whether the publication and the verification happened as specified. They take no position on any outcome, candidate, party, or voting system or technology. A failed check is recorded as a Finding under D40 and blocks no act. Where R11 or R38 requires that a vote meets Right 13, it meets it only where every check returns MEETS.

Where these numbers come from. One year: Venice Commission, Code of Good Practice in Electoral Matters, Guideline II.2.b. Significance level, margin-based sample size and size-proportional selection: acceptance sampling and audit practice, as above. Secret ballot: a protection the jurisdiction's own law already carries. Delivery rates and the length of the review window: TCORF's own figures, borrowed from no standard.
What the sample does not reach: ballots altered, added or removed before counting, and a recount that repeats the original count instead of being independent of it. The roll, turnout, conditions and custody requirements below exist because the sample cannot test them.
Not applicable where no public vote was held in the period, which is recorded as such rather than as a gap. Blocks marked *where used* are not applicable where the jurisdiction does not provide that channel.
Count records are tested as published. This extension requires no personal data about any voter or official to be collected or republished.
Fundamental elements = the electoral system proper, membership of electoral commissions, and the drawing of constituency boundaries.
Count unit = the smallest unit at which ballots are counted and a result is recorded, whatever it is called.
Remote channel = postal, advance, proxy or digital voting, where the jurisdiction provides it.
Count record = the statement of the count for one count unit: ballots issued, ballots cast, unused, spoiled, and votes per option.
Manifest = the complete list of count records from which the sample is drawn.
Revision entry = a dated record of a change to a published figure, stating the previous value.
Election period = the campaign period, through to the declaration of the final result, and until the office concerned is taken up.

Data specification

Rules in force. The fundamental elements are not open to amendment less than one year before the vote, or are entrenched in the constitution or in a law ranking above ordinary legislation. Any amendment inside the year carries its justification and the record of its review. Why: rules rewritten during a campaign were written by people who could see the campaign.

Conditions. Per count unit: location and hours; ballot options; registration requirements and deadlines; identity and eligibility requirements; rejection reasons and their codes; observer accreditation terms. Published before the first voting day, and published per region and voter group so that comparable voters can be seen to face comparable rules. Differences are published with their stated basis. The spread is the output; this extension sets no tolerance on it.

Electoral roll. Roll count per count unit published before the first voting day and unchanged through the vote. Additions and removals since the previous vote of the same type published per unit, with their dates, so the period immediately before the roll closes is visible on its own. The roll compared against the published population figures for the same unit [REF:D32-R17-EXT]. Why: a roll can be changed instead of a count, in either direction, and the last weeks are when it is worth changing.

Turnout. Turnout published per count unit against the roll for that unit, so that both the level and its spread across units are visible. Why: turnout cannot exceed the roll, and turnout that is identical across units was not produced by voters.

Access, and remote channels where used. Capacity, locations and timing published per unit. Where a remote channel is used, its chain is published per unit: requested, issued, delivered, returned, accepted, rejected, with a reason code for every rejection; at least 90% delivered and processed in time, and no region or voter group below 85% without a documented reason. TCORF's own figures. Where the jurisdiction's postal regulator publishes a quality-of-service standard, the actual rate is published against it too.

Candidate field. The list of candidates and options published. Every removal or disqualification published with its rule reference, reason and date. Ballot-access criteria published and applied on their published terms.

Campaign record. Broadcast and platform access data, logs and recordings retained and retrievable for the election period, at a granularity that permits coverage to be compared between candidates and options. Why: a balance that cannot be measured cannot be discussed, and the absence of the logs is itself the finding.

Official action during the period. Investigations, prosecutions, detentions, licensing and regulatory actions affecting candidates, campaigns or their financial backers, and the deployment of police, security or military personnel at voting sites, counting locations and observer locations, published with dates for the election period. Why: these are published facts about official conduct, not assessments of it.

The count. Ballots are counted in the count unit where they were cast, or at a published location where the channel has no casting unit, with witnesses present from more than one body representing opposing positions, and accredited observers admitted. An invitation declined is recorded as declined. Containers are sealed tamper-evidently and each transfer is recorded with time, custody and witnesses. The count produces a count record, published before any central figure, with a copy issued to each witness present. Results are published at the smallest count unit that does not reveal how individuals voted; where a unit is too small, it is combined with an adjacent unit and the combination is published. Why: a count nobody present can observe, and a publication that identifies a voter, each defeat the purpose of the other.

Reconciliation. Ballots issued, cast, unused and spoiled reconcile against each other within the count unit. Unused ballots remain at the unit until reconciled.

Verification. The significance level is 5% or lower. It, the sample-size method, the selection procedure and the escalation rule are published before the first voting day. The sample size is computed from the published significance level and the reported margin, so that a sample of that size would detect a changed outcome with probability of at least $1 - \alpha$; the computation and every input to it are published with the result, so that anyone can recompute the required size independently. The sample is selected only after the count records and the manifest are published, at an announced time, in public, by the published procedure, from a frame containing every count unit, each with a known non-zero chance of selection and drawn with probability proportional to its size. The selection is performed once; a later selection replaces nothing. Custody of counted ballots is recorded continuously from count to recount. Each selected unit is recounted in full by personnel other than those who performed the original count — independence is by role, not by origin, so personnel from another unit or nominated by another body satisfy it, and the recount takes place where the ballots are unless custody of a transfer is recorded. Where the sample does not confirm the reported outcome at the significance level, or where the differences found lean predominantly in one direction, escalation applies and continues until a full hand count is completed. Why: a published level with no computation behind it fixes nothing; a unit identifiable in advance can be

prepared in advance; a sample drawn from an incomplete manifest, or recounted by the same hands, tests nothing; and an escalation that can stop early carries no guarantee.

Release sequence. 1 — counts completed per count unit. 2 — count records published and issued. 3 — reported figures reconciled against count records. 4 — manifest published. 5 — sample selected in public from the published manifest. 6 — selected units recounted independently. 7 — escalation completed where triggered, and independent review completed within a published window of not less than 24 hours. TCORF's own figure. 8 — the result carries the status final. Figures are published as they arise at every step; only the status changes at step 8. Why: holding the numbers back would withhold information. This holds back the status, not the data.

Complaints. Logged with date received, data released, inspection granted or refused with reason, and date closed. Published in aggregate per count unit.

Retention and format. Conditions, roll counts, turnout, channel chains, count records, manifests, selection records, sample-size computations, sample results, escalation records, complaint logs and revision entries, retained 25 years. Free, no registration, no tracking, bulk-downloadable.

What to produce
Filed under D40 with: right number and title; failed check ID; the vote concerned; the count units, regions or groups concerned; where looked for; retrieval date.
Label note: the substantive criterion sits in D31. These checks establish the facts it turns on.

Checks

C1 — Rules stable · before the vote (prevents: rules rewritten once the campaign is visible)
Check: Were the fundamental elements unamended for one year before the vote, or entrenched above ordinary legislation?
How: Compare amendment dates to the vote date; check the rank of the instrument.
MEETS: no amendment inside one year, or entrenched; any amendment inside the year carries its justification and review record.
GAP: a fundamental element amended inside the year; no justification or traceable review; a change relabelled technical to avoid the rule.

C2 — Comparable voters, comparable rules · before the vote (prevents: one electorate run under several rulebooks)
Check: Are the conditions published per region and voter group, and are differences published with their basis?
How: Read the published conditions across regions and groups; compare.
MEETS: published for every region and group; each difference carries its stated basis.
GAP: regions or groups missing; conditions published nationally only; differences present with no basis published.

C3 — Official action published and even-handed · before the vote (prevents: a result secured by the state's own instruments)
Check: Are investigations, prosecutions, detentions, regulatory actions and security deployments published with dates for the election period, and is the record even-handed across candidates and options?
How: Retrieve the published record; read it against the candidate and option list; compare timing and distribution.
MEETS: published with dates and retrievable for the whole period, with no concentration on one side, or each action carrying published due-process evidence.
GAP: the record unpublished or partial; police, tax, licensing, regulatory or security action against

candidates, campaigns or their financial backers concentrated on one side inside the year before the vote; detentions or removals of candidates with no published due-process record, including in the period after the declaration; security deployments beyond those published.

C4 — Roll sound and fixed · before the vote (prevents: an electorate changed instead of a count)
Check: Is the roll count published per unit, fixed through the vote, with dated additions and removals since the previous vote, and does it reconcile against the population figures for the same unit?
How: Compare opening and closing counts; read the dated additions and removals; compare the roll to published population.
MEETS: published and unchanged, or changed with a revision entry; additions and removals published per unit with dates; roll consistent with population.
GAP: roll exceeding the population of the unit; removals unpublished; additions concentrated by region or group with no published criterion; additions concentrated in particular units in the period immediately before the roll closed, with no published basis; counts unpublished or inconsistent. Cross-reference R9.

C5 — Turnout plausible · after the count (prevents: votes that no voters cast)
Check: Is turnout published per count unit, at or below the roll everywhere, and does its spread across units look like voters rather than a target?
How: Compute turnout per unit from published figures; compare against the roll; compare units against each other.
MEETS: turnout published per unit, at or below the roll in every unit, with variation across units.
GAP: turnout above the roll in any unit; turnout at or near identical across units; turnout published only in aggregate.

C6 — Access, and remote channels where used · before the vote; channel rates after the count (prevents: a right to vote nobody could exercise)
Check: Do published capacity, locations and timing permit the roll of each unit to vote — and where a remote channel is used, is its chain complete with the rates met?
How: Compare capacity and hours to the roll per unit; retrieve the channel chain and compute the rates.
MEETS: capacity and hours sufficient in every unit; where a channel is used, all six stages present per unit, every rejection coded, 90% overall and no region or group below 85%, or a shortfall with its documented reason.
GAP: units where capacity or hours cannot accommodate the roll; access delivered too late to use; a chain stage missing; rejection reasons vague or absent; rates below the figures with no reason published; chain figures inconsistent with the reported outcome.

C7 — Candidate field published, traceable and contested · before the vote (prevents: a vote with the field decided in advance)
Check: Is the list of candidates and options published, every removal traceable to rule, reason and date, the ballot-access criteria published and applied on their terms, and was the field contested?
How: Read the list, the removals record and the access criteria; compare access to ballot, funding and coverage across options.
MEETS: list published; each removal carries rule reference, reason and date; criteria published and applied as published; more than one option contesting with a realistic ability to win.
GAP: only one option on the ballot, or opponents without a realistic ability to win; major options removed close to the vote with no evidence trail; criteria unpublished or applied unevenly.

C8 — Campaign record retrievable and coverage not concentrated · before the vote (prevents: a balance nobody can check, and one nobody contests)
Check: Are access data, logs and recordings retained and retrievable at a granularity that permits coverage to be compared between options — and is coverage concentrated on one side?
How: Retrieve the logs; compute coverage per option; compare across options and channels.
MEETS: logs retrievable, coverage per option computable, and not systematically concentrated on one side.
GAP: logs unavailable, incomplete, or too coarse to compare; access conditioned on anything; state-linked channels outside the record; coverage systematically concentrated on one side, especially through state-linked channels; hostility or smear directed at particular options, amplified by state resources.

C9 — No inducement or coercion recorded · before the vote (prevents: votes bought or extracted rather than cast)
Check: Do the complaint log and the published record show vote buying, workplace pressure tied to voting choice, or organised transport of voters with no published basis?
How: Read the complaint log and the published record; follow each entry to closure.
MEETS: no such entries, or entries present and each closed with published evidence.
GAP: entries present and unresolved; benefits offered against votes; retaliation threats tied to voting choice; organised transport whose organiser, route and funding are unpublished.

C10 — Counted in the open, with custody · after the count (prevents: a count nobody present can observe)
Check: Were ballots counted in the unit where cast or at a published location, with witnesses from more than one opposing body, observers admitted, seals intact and every transfer recorded?
How: Read count records, seal records, transfer records and the observer admission record.
MEETS: counted in the unit or at a published location; witnesses from more than one opposing body, recorded by body, or an invitation recorded as declined; observers admitted; seals recorded; transfers recorded with time and custody.
GAP: ballots moved before counting with no custody record; witnesses from one body only with no declined record; observers refused, expelled or accredited too late; seals absent, broken or unrecorded; pre-marked ballots, handoffs or swapping recorded.

C11 — The count unit reconciles · after the count (prevents: more ballots counted than issued)
Check: Do ballots issued, cast, unused and spoiled reconcile within each unit, with unused ballots held at the unit until reconciled?
How: Recompute from the published count record for every unit; check the unused-ballot record.
MEETS: the four figures reconcile in every unit; unused ballots accounted for at the unit.
GAP: cast exceeding issued; unused ballots removed before reconciliation or unrecorded; repeat-voting anomalies unresolved; a unit with no reconciliation figures.

C12 — Count records published and issued · after the count (prevents: a count that leaves no document behind)
Check: Is a count record published per count unit before any central figure, at the smallest unit that does not reveal how individuals voted, with a copy issued to each witness present?
How: Retrieve the records; check the publication order, the combination rule where units were combined, and the issuing record.
MEETS: published per unit before central figures; units too small combined with the combination published; issue recorded.
GAP: records aggregated above unit level with no secrecy basis; central figures appearing before unit records; records held but not published; no issue recorded.

C13 — Reported figure equals the count records · after the count (prevents: a figure substituted between the unit and the announcement)
Check: Does the reported result equal the published count records, unit by unit?
How: Sum the count records and compare per unit and in total.
MEETS: equal, or every difference carries a revision entry stating the previous value.
GAP: any unit where the reported figure differs with no revision entry; totals matching while units do not.

C14 — Count verified by sample · after the count (prevents: a result nobody re-measured, and an inspection the inspected party can predict)
Check: Was the sample size computed from the published significance level and the reported margin, and the sample then selected after the count records and manifest were published, in public and by the published procedure, from a frame containing every count unit, with custody continuous and each selected unit recounted in full by other personnel?
How: Recompute the required size from the published inputs; compare the selection time to the publication of the records and manifest; check the selection record against the published procedure; compare the frame to the full unit list; check the custody log and who recounted, by role and unit.
MEETS: significance level published at 5% or lower; the published computation reaches a detection probability of at least $1 - \alpha$ at the reported margin and is reproducible from the published inputs; size as computed or larger; selected after publication, in public, by the published procedure, from a complete frame with size-proportional probability; one selection only; custody unbroken; recount by personnel other than the original counters.
GAP: a significance level above 5%; a fixed sample size unrelated to the margin; a computation that cannot be reproduced from the published inputs, or that does not reach $1 - \alpha$ at the reported margin; sample smaller than computed; the sample selected, or the seed fixed, before the records and manifest were published; a selection anyone could compute in advance; units absent from the frame or exempted from selection; a second selection after the first; a custody gap; the original counters recounting.

C15 — Escalation completed · after the count (prevents: a verification abandoned before it concludes)
Check: Where the sample did not confirm the outcome at the significance level, or the differences leaned predominantly one way, did escalation continue to a completed full hand count?
How: Compare sample results to reported figures; read the direction of the differences; read the escalation record.
MEETS: confirmed and no one-sided lean; or escalated and carried to a completed full hand count.
GAP: not confirmed and not escalated; differences leaning one way with no escalation; escalation stopped part way; escalation terms changed after the trigger; recounts blocked, delayed or discretionary.

C16 — Review before final status · after the count (prevents: review that happens once the result is fixed)
Check: Was independent review completed within the published window before the result became official, and were reviewers unobstructed in publishing findings?
How: Compare review and window dates to the final-status date; check whether findings were published.
MEETS: review completed inside the published window before final status; findings published without obstruction.
GAP: review only after the result became official; no window, or one shorter than published; reviewers blocked, pressured or barred from publishing.

C17 — Nothing final before the sequence ended · after the count (prevents: a result announced and then revised)
Check: Did the result carry the status final only after step 8?
How: Compare the final-status date to the completion of steps 1 to 7.
MEETS: final status after step 8; earlier publications presented as provisional.
GAP: final status before the checks completed; final status on the night of the vote with verification following; a provisional figure later revised with no revision entry.

C18 — Evidence retrievable, complaints answered · after the count (prevents: a record that exists but cannot be reached)
Check: Are all items under Retention and format retrievable free, without registration or tracking, in bulk — and does the complaint log show data released and inspection granted?
How: Retrieve them; compare a figure to the same figure retrieved earlier; read the log to closure.
MEETS: all retrievable on those terms; figures unchanged or changed with revision entries; each complaint carries data released or a published reason for refusal, and a closure date.
GAP: fees, registration or tracking; single-query access only; an item missing; a figure altered with no revision entry; press statements or summaries in place of the underlying records; complaints unlogged, delayed, refused, or closed with evidence that cannot be retrieved.

Operational Note: review the Disclaimer (D53) before deployment. C3, C7 and C8 rest on judgment rather than arithmetic and are the most likely to draw a reaction. All three can be run and recorded privately before the vote; Shadow Audit is the default (D53, Section 4).

Category 5: Executive Accountability

15. Management Q&A Safeguard [AUDIT EFFECT]

Extension ID: D32-R15-EXT

Entry
- Scope. Specifies the session D31 requires and how an Owner tests it. The Organization or the Owner may set further detail, keeping the intent.
- Why. Millions of Owners cannot inspect management themselves. A live, recorded session in which the leader answers questions is the substitute that scales, and leaves a dated trail of what was promised, done and followed.
- The room, not the answers. Judging an answer takes a side. What filters a Q&A is visible: who appears, how long they listen, who may ask, who gives the floor, what is kept. Each is in the Organization's hands and can be checked. The answers are left to Owners.
- Limits. Nothing here sets topics for the press, judges any outlet or obliges an answer in substance. A failed check proves no wrongdoing; it shows where a filter sits.

Definitions
- Session: a live status report by the leader, followed by questions from accredited questioners in the room.
- Leader: the person with the highest executive power in each body with its own head: government, ministry, authority, agency, police, military, public school or hospital, city, company, HOA board. Not a ceremonial head. Spokespersons and PR staff never stand in.
- People served: residents of the territory, or of a provider's service area.

Data specification
- Cadence. Above 1 million people served: monthly. Above 100,000: quarterly. Otherwise: twice a year. A cancelled session not held again in the same period counts as missed.
- Extra sessions. The Organization may hold further Q&As, including with deputies or experts. These rules bind only the minimum sessions above; an extra session never replaces one.
- Presence. The leader in person as a rule, answering at least half the questions personally; a deputy with decision authority only for a published reason.
- Format. A short status report on the mandate (R12) and current operations, then questions for the larger part of the session, follow-ups allowed.
- Access. Accreditation on published, objective criteria, open to anyone doing journalism; each refusal published with its reason. Session announced in advance (e.g. 7 days); a later change of date, time or place counts as not announced.
- Floor. Given by a chair independent of the Organization, or in a published order. No questions screened in advance. Nobody asks twice before all who wish have asked once.
- Follow-up. Questions declined, deferred, or flagged by the questioner as not answered get a written answer, or a written refusal with reason, within 30 days (D40 §17).
- Record. Unedited audio and video, transcript and the list of open questions, published promptly; free, no registration, retained 25 years.
- Empty room. A session held on these terms with no questioner present is recorded, not failed.

What to produce
- Filed under D40 with: right number and title; failed checkpoint (e.g. R15-C3); body, leader, session date or period; where looked for; retrieval date.
- Label note: [AUDIT EFFECT] — remedies apply only to Request Not Handled under D40. These checks establish the facts a request states.

Checks

C1 — Held on cadence
Prevents: sessions that vanish when scrutiny rises.
- Check: Minimum sessions held at the cadence for the people served?
- How: Count dated recordings per period.
- MEETS: Every period covered.
- GAP: A period missed; gaps around contested events; an extra session counted instead.

C2 — The leader in person
Prevents: a spokesperson standing in for the one who decides.
- Check: Leader present and answering at least half, or a deputy for a published reason?
- How: Read attendance and count answers in the recordings.
- MEETS: As specified.
- GAP: Spokesperson or PR staff only; aides answer most questions; leader leaves before the questions.

C3 — Real time for questions
Prevents: a speech with questions attached.
- Check: Short report on mandate and operations; questions take the larger part?
- How: Time both parts in the recording.
- MEETS: Both.
- GAP: Questions cut while some remain; mandate or operations left out.

C4 — Access on published terms
Prevents: a press corps chosen by the Organization.
- Check: Objective criteria published; refusals published with reason; session announced and kept?
- How: Read criteria and refusals; compare with who applied; compare announcement with session.
- MEETS: All three.
- GAP: Discretionary criteria; a refusal without reason; announced to some only; moved at short notice.

C5 — Floor not held by the Organization
Prevents: chosen questioners, screened questions.
- Check: Independent chair or published order; no questions screened; everyone's first turn before anyone's second?
- How: Read the rules; watch who gives the floor.
- MEETS: All three.
- GAP: Staff pick questioners; questions required in advance; a second turn while others wait; a microphone cut.

C6 — Open questions closed in writing
Prevents: "we will follow up", and nothing follows.
- Check: Declined, deferred or flagged questions answered or refused in writing within 30 days?
- How: Compare the open-question list with the written answers.
- MEETS: All closed in time.
- GAP: Open after 30 days; a deferred or flagged question missing from the list.

C7 — Record complete and kept
Prevents: a session nobody can review later.
- Check: Unedited record published promptly, free, retrievable for 25 years?
- How: Compare recording length with the session; retrieve the oldest year.
- MEETS: All met.
- GAP: Question part missing; undisclosed cuts; recordings removed; login or fee.

Recorded, never failed
- the content of any answer
- "no comment"
- few outlets asking
- fewer questioners over time
- an empty room

Retaliation against a questioner falls under R2 [REF:D31-R2].

Operational Note: review the Disclaimer (D53) before deployment. Shadow Audit is the default (D53, Section 4).

Category 6: Systemic Transparency

16. Spending and Contract Transparency Safeguard [AUDIT EFFECT]

Extension ID: D32-R16-EXT

Entry
Specifies the spending and contract record D31 requires: what it covers, the fields per entry, how it is reached, and how an Owner tests it.
The specification is a benchmark. A gap between it and what the Organization publishes is measured and recorded, not breached — nothing here blocks a payment, cancels a contract or requires a spending decision to be explained. These checks test whether the record exists and can be used; they take no position on whether any item of spending was justified.
No Organization is expected to meet this in full today. The useful finding is usually the specific gap — a missing category, an unreachable archive, a withholding with no stub — rather than the overall verdict.

Data specification
Coverage.
- Procurement and contracts, including tenders, purchase orders and subcontracts; invoices, receipts and payment confirmations
- loans, credits, guarantees, debt instruments and leases
- projects with budget and cost evolution
- subsidiaries
- outsourcing agreements and investments
- donations, grants, subsidies, forgiven debts and other transfers
- personnel spend.

Each entry marked domestic or international.

Exclusion. Two categories may be withheld: deep military operations, and intelligence operations of any kind. Every entry withheld is a commitment the Owner funds without seeing, so the carve-out is a concession made against the Owner's interest, not a category the Organization is entitled to. The

intelligence side is drawn wide deliberately, because sources and methods can be inferred from fragments that look ordinary; the military side is not, because most military spending is ordinary procurement. What is withheld is an operation, never a body. Ordinary procurement, facilities, administration and personnel spend stay disclosed for both, and a police, customs or financial-crime unit with an intelligence function is not thereby exempt for its other activity.
Time is not a criterion. Withholding is justified by what the operation is, never by how recently it happened — and since the Owner is already paying, a delay is not a lesser form of disclosure but a period during which the bill is unseen. An entry outside the two categories is disclosed on the same 30-day schedule as any other, with no period, however short, for which it may be held back. Sealing periods in archive or contract law do not create a confidentiality standard.

Fields per entry. Contracting parties, including subcontractors; signing date, effective date, duration; purpose and the unit accountable for it; where performed; total value, assets involved, and the scanned original; every extension and modification attached to the original entry rather than replacing it.
Cadence and archive. New entries searchable within 30 days of initiation — a payment findable only after the budget year closes cannot be questioned while anything can still be done about it. Comprehensive refresh at least quarterly. Archive depth 25 years.

Format and query. Free, no registration, no tracking. Filterable and sortable by counterparty, unit, date range, value and category; downloadable individually and in bulk, in open formats such as CSV or JSON. A register that can only be read one entry at a time discloses nothing an Owner can act on.

Normalization. Large totals — debt, assets, spending, transfers — are published per resident, per citizen, per taxpayer and per citizen-taxpayer alongside the total, so an Owner can read scale without arithmetic.

Completeness. Category totals reconcile to the reported total: domestic plus international, and operational plus investment plus debt service plus transfers. A record that does not reconcile is incomplete regardless of how many entries it holds.

Checks

C1 — One record, publicly reachable (prevents: transparency that requires knowing which agency to ask)
Check: Is there a single official record where entries across the Organization are searchable, without fee, registration or tracking?
How: Look for the central portal or open-data catalogue; try a search for a known contract; attempt access without an account.
MEETS: one entry point covering the Organization; free; searchable.
GAP: entries scattered across agency pages; login, payment or tracking consent required; PDF dumps with no search; a portal covering only part of the Organization.

C2 — Coverage is whole (prevents: a complete-looking record missing the categories that matter)
Check: Are all listed categories present, with domestic and international marked?
How: Search the record for each category in turn. Cross-check against the published budget: named programs, subsidiaries and large transfers should each appear as entries.
MEETS: each category populated; the budget's large items traceable to entries.
GAP: a category absent; high-value items grouped under vague labels; subsidiaries or outsourcing missing; a budget line with no corresponding entries.

C3 — Exclusions are bounded (prevents: a label that removes the right)
Check: Is a published standard in place for both categories, and does every withheld entry appear as a stub citing it?
How: Look for the standard; then search for stubs and compare their count and value against total spend

of the bodies concerned.
MEETS: standard published with criteria and certifying authority; withheld entries present as stubs; ordinary procurement, facilities and personnel spend of military and intelligence bodies disclosed normally.
GAP: no published standard; withholding with no stub; whole bodies absent rather than individual operations; routine spend withheld under the label; a unit with an intelligence function exempt for its other activity.

C4 — No secrecy outside the two categories (prevents: any-duration withholding for other reasons)
Check: Is every withheld entry certified as a deep military or an intelligence operation — with nothing withheld on any other ground, for any period?
How: Read the stubs and the criterion each cites. Check whether any archive, procurement or contract law imposes a general sealing period the Organization applies. Look for entries delayed or held pending signature, completion or negotiation.
MEETS: every withholding cites a published criterion in one of the two categories; nothing held on commercial, procedural or reputational grounds; sensitive figures redacted inside published entries.
GAP: any withholding on another ground, however brief; a default sealing period applied to contracts generally; entries held until completion, expiry or a review date; "temporarily unavailable" with no criterion cited.

C5 — Entries are auditable individually (prevents: a record that lists transactions without the facts that make them checkable)
Check: Does each entry carry all specified fields, with modifications attached rather than overwriting?
How: Open a sample across categories and years; check each field; find an entry known to have been amended and see whether the original survives.
MEETS: fields consistently present; subcontractors named; originals attached; amendment history intact.
GAP: parties or amounts missing; subcontractors unnamed; no scanned originals; an amendment replacing the prior record.

C6 — Current and deep (prevents: a record that arrives too late to matter, or forgets)
Check: Do new entries appear within 30 days of initiation, and does the archive reach 25 years?
How: Compare initiation dates against first appearance for recent entries; test the oldest retrievable year.
MEETS: 30-day lag met consistently; quarterly refresh observable; 25 years retrievable.
GAP: delays clustering around contested periods; archive gaps or broken historical access; refresh announced but not comprehensive.

C7 — Queryable, not merely searchable (prevents: a complete record in which nothing can be found)
Check: Can an Owner filter and sort by counterparty, unit, date range, value and category, and export the filtered result?
How: Run three queries — all contracts with one named supplier; all entries above a value threshold in one year; all transfers by one unit — and export each result.
MEETS: all three return complete results and export in an open format.
GAP: free-text search only; filters absent for counterparty, value or date; results capped without the cap stated; export limited to the visible page.

C8 — Adds up as a whole (prevents: a record accurate entry by entry and wrong in aggregate)
Check: Do category totals reconcile to the reported total?
How: Sum the categories and compare against the reported total.
MEETS: categories reconcile.
GAP: categories not summing.

Operational Note: review the Disclaimer (D53) before deployment.

17. Public Statistics Integrity Safeguard [STOP CONDITION]

Extension ID: D32-R17-EXT

ENTRY
Specifies the recurring statistical release: which figures, at what granularity, on what cadence, and the per-person layer that makes them readable.

Statistics, not records.
A record is a single event — a contract, an invoice, a payment — and it is checked by retrieving it. A statistic is a count or a sum over a period, and nothing inside one figure shows whether a category was dropped or last year's value since changed. Aggregates are checked instead by whether their parts sum and whether their history survives, which is why they need a specification of their own.
Neither substitutes for the other: a complete document archive can sit beside a series with a category quietly missing, and would not expose it. The scope stated in D31 follows from that — what is tested here is the series, never a document inside it.

Negative boundary.
These checks test whether the figures are published, divided, reconciled and kept. They take no position on whether any figure is good or any policy correct: a high ratio is not a failure and a low one is not a pass.

Definition.
Revision entry = a dated record stating what changed, why and when, published beside the figure it corrects.

DATA SPECIFICATION

Coverage
Ten datasets, released together at one location: five counting people, five counting the Organization.
A dataset outside the Organization's function is published as not applicable with the reason, never omitted.
Why: silence and absence are indistinguishable to an Owner.

Shared breakdown terms

Age group	0–17 | 18–24 | 25–44 | 45–64 | 65 and over
Employment	employed | self-employed | unemployed | not in labour force | retired
Citizenship	Residents by citizenship | citizen | non-citizen

Why fixed bands: a breakdown whose boundaries move between periods cannot form a series. Five groups is the fewest that separates dependency, early working life, main working life, late working life and retirement.

PEOPLE

1 — POPULATION AND MOVEMENT

Stocks, at period end

- Residents
- Citizens
- Taxpayers
- Citizen-taxpayers

Vital events, during the period

- Births
- Deaths
- Homicides
- Suicides

Movement, during the period

- Arrivals
- Departures

Breakdown

- Stocks: by age group, by citizenship status, by employment status
- Vital events: by age group
- Arrivals and departures: by sex, by age group, by citizenship status

Why gross, not net: a single net figure cannot show whether a stable population is settled or churning.

2 — INCOME AND SUPPORT

- Average monthly compensation, active employees
- Average pension disbursement
- Average unemployment assistance payment
    - the conditions it is paid under: contribution history required, waiting period, maximum duration, and how the amount is set
    - the payment that follows when entitlement ends, and its conditions
    - persons whose entitlement ended in the period: count; of which, count moving to the follow-on payment
- Beneficiaries, social assistance programs: count
- Beneficiaries, nutritional support programs: count

Breakdown: averages by age group and employment status; beneficiary counts by age group.

Why the conditions beside the amount: an average payment without its duration is a number, not a statistic. Why the exit counts: the drop at the end of entitlement exists nowhere else, and the two payments published side by side show it as one figure.

3 — SOCIAL AND PROTECTIVE

- **Children in institutional residence: count**
  Every person under 18 living under state direction outside a family household, whatever the setting is called: children's home, orphanage, group home, residential school, therapeutic unit, secure unit, reception or reception-and-care centre.
- **Children in family placement: count** (foster and kinship care)
- **Persons with documented disabilities: count**
- **Homeless population: census count**

Breakdown

- All four: by age group
- Institutional residence and family placement: by duration bracket — under 3 months | 3 months to 1 year | 1 to 5 years | over 5 years
- Homeless population: sheltered | unsheltered
- Documented disabilities: the recognition criterion in force, published with the count

Boundary: a child held under detention is counted in dataset 4, never here. Dataset 4 publishes its own under-18 figure, so no child appears in both and none falls between them.

4 — DETENTION

Persons held in state-directed detention or imprisonment, at period end.

Breakdown

- By legal ground
- By duration bracket: under 48 hours | 48 hours to 30 days | 30 days to 1 year | over 1 year
- Of which persons under 18: count, by legal ground and duration bracket

Why brackets: without them, overnight holding and multi-year imprisonment are one number.
Most referenced statistics already exist; where one does not, its absence is the finding.

THE ORGANIZATION

5 — STAFFING

- Internal employee count
- External contractor count

6 — OBLIGATIONS AND SPENDING

- Total debt
- Interest paid
- Spending, by category
- Project spending, by category

Breakdown of total spending

- By destination: domestic | international
- By recipient type: public | private | NGO | individual | other

Why recipient type: category alone shows what was bought, never who received it, and the two answer different questions.

7 — ASSETS

- Property: land and buildings
- Liquidity: cash and bank balances
- Securities
- Outstanding receivables

8 — TRANSFERS

- Given: public assets or claims transferred or forgiven without market compensation, by recipient type
- Received: funds and assets, by source and by type

Why given transfers are separated from spending: an asset handed over without market compensation leaves no purchase to point at, and disappears inside a spending category.

9 — TAXES

Catalogue — every tax, tariff, fee and mandatory levy. Per levy:

- Name
- Who pays
- What is taxed
- Rate structure, with thresholds
- Exemptions
- Amount collected this period
- Destination: general budget, or named purpose
- Where a named purpose: amount spent on that purpose this period

Collection cost

- Cost-of-collection ratio = total cost of collection / total value collected

Effective rate borne, by income band

- Highest, lowest and average effective rate for each of: top 1% | 2–5% | 6–50% | bottom 50%
- Effective rate = total tax due / total income

Embedded tax in essential goods

- For fuel, food, electricity, gas and water: the tax contained in the retail price, split into consumption tax | tariff | environmental levy | other indirect tax

Why the rate structure: a collected figure without it is a number, not a statistic.
Why purpose-spend beside purpose-collect: a levy raised for one thing and spent on another is visible only when both figures sit together.
Why the effective rate and not the headline rate: statutory rates describe a schedule, effective rates describe what was paid, and the gap between them is where exemptions live.
Why embedded tax: the price at the till cannot be separated from the levy inside it, and these five goods are the ones nobody can decline to buy.

10 — LEGAL AND MEDIA

- Active judicial proceedings involving the Organization: count
- Proceedings involving media or publication: count
- Mandatory public rectifications or corrections issued: count

Why counts, not outcomes: whether a proceeding was justified is contestable; whether it exists is not.

Exclusion boundary

Only individual identification is withheld. Every figure is an aggregate count.
Nothing is withheld as sensitive, provisional or under revision.
Why: "provisional" on a standing series is indefinite withholding with a deadline that never arrives.

Completeness

Every breakdown sums to its stated total:

- Age groups → total residents (D1)
- Employment statuses → total residents (D1)
- Citizenship statuses → total residents (D1)
- Detention grounds → total detained
- Detention duration brackets → total detained
- Institutional residence + family placement + detained under-18s → total children under state direction
- Spending categories → total spending
- Spending by destination → total spending
- Spending by recipient type → total spending
- Asset categories → total assets
- Tax collection → total tax revenue
- Embedded tax components → total embedded tax per good

Why: a set that does not sum means a category is missing or counted twice.

Cadence
Quarterly, within 45 days of period end. All ten datasets on the same cycle. The tax catalogue is republished on change.
Why 45 days: an annual-only figure first appears after the year it describes has closed.
Why one cycle: a shared cycle is what lets the ten be read against each other.
Retention
Ten years retrievable and unmodified. Corrections appear as revision entries, never as edits.
Why ten years: it spans more than one administration.
Why revision entries: a series that can be silently replaced is not a series.
Format

- Free; no registration; no tracking
- Stable location
- Bulk download, open format such as CSV or JSON

Why bulk: a figure readable one record at a time cannot be checked against anything.
Definitions
Each field published with its inclusion rule, its unit, and the source system it came from.
Why: an Organization that changes what it counts as a taxpayer without saying so produces a series that looks continuous and is not.

MEASUREMENT

Denominators
Each published as a count, with source and count date.

D1	Residents	All persons resident, from the official register or latest census
D2	Citizens (Owners)	Persons holding citizenship
D3	Taxpayers	All four criteria must be fulfilled: - citizens (wherever they live) or residents - 18 years old and over - main income is not social transfer or pension (last year) - paid personal income tax at least in one of the last three years
D4	Citizen-taxpayers	Persons in both D2 and D3

Why four denominators:
A single denominator is a choice, and whoever makes it sets the headline. Divide by residents and a debt looks light; divide by citizen-taxpayers and the same debt looks heavy. Neither is wrong — each answers a different question, and an organization free to pick one will pick the flattering one. Four denominators, fixed before the figure is produced, remove that choice.
***Per resident** — everyone present and drawing on what the total funds: load.*
***Per citizen(=Owner)** — those who cannot exit the obligation without surrendering membership: commitment, independent of what anyone currently pays.*
***Per taxpayer** — those funding it now: present capacity, and nothing about the future.*
***Per citizen-taxpayer** — funding it now and unable to leave cheaply. For obligations outlasting a business cycle, this is what remains when the mobile part of the base is gone.*

The spread between the four is the finding. Where they converge, the burden is broadly carried; where per citizen-taxpayer sits far above per resident, the total rests on a narrower set than the headline suggests. The taxpayer threshold is set at one unit of tax, deliberately low, to close the obvious route to inflating that figure. These are measurement conventions. They take no position on who should bear a burden or who belongs. The four overlap and need not add up: residents minus non-citizen residents is not Citizens, because citizens abroad count in D2 but not in D1. A large gap is a finding, not an error.

Rule
Every monetary total in datasets 6 to 9 is published beside its value divided by each applicable denominator, from the same period and territory.
Ratio = Total / Denominator
Applicability

- Per resident: always
- Per citizen, per taxpayer, per citizen-taxpayer: where the Organization records the status
- Where it does not: the denominator is published as unavailable with the reason, not omitted

Movement
Each denominator is published with its change since the previous period, split into components:

- D1: births, deaths, arrivals, departures
- D2: births to citizens, deaths, naturalizations, renunciations

Why: a ratio whose denominator moved for unstated reasons cannot be compared to the period before.
Worked example — illustrative figures, no audit meaning
Total debt: 2,400,000,000,000

	Denominator	Count	Ratio
D1	Residents	80,000,000	30,000 per resident
D2	Citizens	72,000,000	33,333 per citizen
D3	Taxpayers	44,000,000	54,545 per taxpayer
D4	Citizen-taxpayers	41,000,000	58,537 per citizen-taxpayer

Comparability
Ratios compare across periods within the Organization. That comparison holds only while the denominator definitions stay fixed, which is why they are published with the counts and why any change of basis requires a restated prior series.
Rounding
Denominators as whole counts. Ratios to the currency unit.

WHAT TO PRODUCE
Collect these while running the checks. Filed under D40 with:

- Right number and title
- Failed checkpoint ID
- Dataset, figure and period concerned
- Where it was looked for
- Retrieval date

Label note: R17 is a [STOP CONDITION]. The substantive criterion sits in D31; the checks below establish the facts it turns on.

CHECKS

C1 — One reachable record

Prevents: figures that exist but must be asked for

- **Check:** Is there one official location holding all ten datasets, reachable without fee, registration or tracking?
- **How:** Statistics page, open-data catalogue or budget portal; try retrieval without an account.
- **MEETS:** One entry point. Free. No login. No tracking.
- **GAP:** Datasets split across departments; login, payment or consent required; available on request only.

C2 — All ten datasets present

Prevents: a release complete except for the category in question

- **Check:** Does the current release carry every dataset and every listed field?
- **How:** Open the release; walk the ten lists field by field.
- **MEETS:** All ten present, all fields populated; any not applicable stated with a reason.
- **GAP:** A dataset absent with no entry; a field missing or blank; a category shown as a label with no figure.

C3 — Denominators defined, movement stated

Prevents: a ratio nobody can verify or compare

- **Check:** Are all four denominators published as counts — each with inclusion rule, source and count date — and each with its change since the previous period, split into components?
- **How:** Data dictionary or release header; compare against the previous release.
- **MEETS:** Four counts. Four definitions with sources and dates. Four movement lines. Unavailable denominators stated with a reason.
- **GAP:** A count without its definition; movement absent or unexplained; a definition changed with no revision entry; a denominator silently dropped.

C4 — Every total carries its per-person figures

Prevents: a total in the form that resists judgment

- **Check:** Does every monetary total in datasets 6 to 9 appear with its value per applicable denominator?
- **How:** Scan the monetary columns of the current release.
- **MEETS:** Each total shown with its per-person figures beside it.
- **GAP:** Totals alone; per-person figures on some totals but not others; a ratio without the total it came from.

C5 — Breakdowns reconcile

Prevents: a category missing or counted twice

- **Check:** Does each breakdown sum to its stated total?
- **How:** For each row of the Completeness list, add the published subgroups and compare to the published total.
- **MEETS:** All twelve listed breakdowns reconcile at the published precision.
- **GAP:** Any set does not sum; an "other" line absorbs the difference without its own figure; totals restated with no revision entry.

C6 — Current

Prevents: a figure arriving after the period it describes is closed

- **Check:** Is the newest release quarterly, and published within 45 days of period end?
- **How:** Compare period covered against publication date, for the last four releases.
- **MEETS:** Four consecutive quarters, each within 45 days.
- **GAP:** Annual only; a gap in the sequence; lag exceeded; delays clustering on contested periods.

C7 — History intact

Prevents: silent retroactive revision

- **Check:** Are ten years retrievable, with every correction carrying a dated revision entry?
- **How:** Retrieve the oldest available release; compare a figure from a prior release against its current value.
- **MEETS:** Ten years retrievable. Prior figures unchanged, or changed with a revision entry stating what, why and when.
- **GAP:** Archive under ten years; broken historical links; a prior figure now different with no revision entry.

C8 — Processable in bulk

Prevents: a complete record in which nothing can be computed

- **Check:** Can the full release be downloaded as one open-format file?
- **How:** Use the download control; open the file.
- **MEETS:** Bulk export in CSV, JSON or equivalent. Machine-readable. Same location each period.
- **GAP:** View-only dashboard; image or non-extractable PDF; export capped at the visible page; location moves each period.

C9 — Breakdown terms unchanged

Prevents: definitional drift that moves a figure without moving anything real

- **Check:** Are the age groups, employment statuses, citizenship statuses and duration brackets the published ones, and identical to the previous period?
- **How:** Compare the current release's breakdown headings against the previous release and against the data dictionary.
- **MEETS:** Every band matches the published definition and the prior period; any change carries a revision entry and a restated prior series.

GAP: A band boundary moved, merged, split or renamed with no revision entry; headings differ from the data dictionary; a changed band with no restated prior series.

18. Transparent Tax Impact Metric [AUDIT EFFECT]

Extension ID: D32-R18-EXT

Entry

Specifies the SSR (Service Self-Purchase Ratio): inputs, calculation, household profiles, publication conditions. The figure is contestable as policy but not as arithmetic, so these checks test reproducibility only. They do not evaluate whether the burden is correct, excessive or well spent — a low SSR is not a pass — and they record what a figure does, never why.

Mandatory Layer = any tax, levy or contribution not optional for the parties to the transaction.

Warning: The SSR measures what is taken, not what is returned or what things cost. It is not financial advice and should not on its own be the basis for a relocation, employment, or tax decision.

Data specification

Scope. National government and regional authority, per D31. Local government excluded: earnings statistics rarely exist at municipal level, so a municipal figure would pair local rates with a non-local baseline. Local taxes remain inside the calculation.

Income Baseline. Median gross annual earnings, FTE employees, national statistics office. The median, not the mean, because mean earnings move with the top of the distribution and would make the figure track high incomes rather than the typical earner. Failing a published median, mean from the same source; failing that, ILO or OECD. State the rung used.

Normalization. Monthly × 12, weekly × 52. Working hours fixed at 1,920/year as a display convention. The SSR does not depend on it: taxes are set on the annual amount, and both sides of the ratio are divided by the same hours. Hourly amounts at a local norm may be shown alongside, with the hours used stated. Brackets, ceilings and allowances are determined on the annual amount and then divided by 1,920; taking them from the hourly figure gives a wrong result.

Profiles, both published at the baseline: P1 single; P2 married with two children. Tax-side relief included, cash transfers excluded — SSR measures extraction, not net position. Refundable relief counts down to zero liability only; any excess paid out is a transfer.

Fields. Period; Reporting Unit; baseline (published value, period, annualized value, rung, source, source date); 1,920 confirmed; profile ID and assumed child ages; each layer (name, rate, amount/hour, legal basis); each relief item (name, amount, basis, liability-reducing portion); rate basis; any ceiling or floor; hourly gross; consumer cost; net income; SSR; methodology version.

Cadence. Annual minimum — statutes change on budget cycles. Newest figure under 12 months. Republication within 90 days of any change to a layer or relief item.

Retention. Full series unmodified, corrections as new dated entries, methodology version per period, 25-year archive.

Format. Free, no registration, no tracking; searchable, downloadable, bulk export.

Rounding. Full precision internally; money and SSR to two decimals; reconciliation holds at two decimals.

Calculation

SSR = Total Consumer Cost ÷ Final Net Income, both from the same baseline.

Up: hourly gross (annual ÷ 1,920) + employer-side costs = salary pool; + taxes owed regardless of profit = service rate; + consumption tax = consumer cost.

Down: hourly gross − employee-side costs − personal income tax after relief = net income.

Consumer cost is identical across profiles; only net income differs.

Adaptation: the sequence follows local law (e.g. income tax before or after insurance deduction), stated in the methodology.

Assumptions: no overhead or margin, so SSR measures the wedge on labour, not business cost; final consumption, tax unrecoverable; profit-based corporate tax out of scope, so a low figure there is not evidence of low burden; the earner buys their own work at their own rate. The figure describes the baseline earner only.

Worked example — annual basis. Illustrative rates (or fixed amounts), no audit meaning.
The identity is a ratio of two amounts over the same period, so it may be computed on annual figures and converted to hours at the end. The result is identical.

Baseline

Input	Value
Median gross annual earnings (rung 1)	40,000.00
Standard working hours	1,920

Up to consumer price — identical for both profiles

Step	Annual
Gross salary	40,000.00
+ Employer-side mandatory costs (15%)	6,000.00
= Salary pool	46,000.00
+ Revenue-based corporate tax (1%)	460.00
= Service rate	46,460.00
+ VAT / GST / sales tax (10%)	4,646.00
= Total consumer price	**51,106.00**

* See Scope of each line below.

Down to net income — personal tax determined annually

Step	P1 single	P2 married, 2 children
Gross salary	40,000.00	40,000.00
− Employee-side mandatory costs (15%)	6,000.00	6,000.00
− Personal income tax (after allowances and credits)	7,200.00	3,600.00
= Final net income	**26,800.00**	**30,400.00**

* See Scope of each line below.

Per hour (÷ 1,920)

Step	P1 single	P2 married, 2 children
Total consumer price	26.6177	26.6177
Final net income	13.9583	15.8333
SSR = consumer price ÷ net income	26.6177 ÷ 13.9583	26.6177 ÷ 15.8333
SSR	**1.91**	**1.68**

P1 works 1.91 hours to buy one hour of the same work/service; P2 works 1.68.

Scope of each line. Each percentage in both tables above is a category, not a single tax. Include every mandatory layer that applies at the location — on employment and on the purchase — at every level of government, listed separately. What counts is that payment is non-optional, not what it is called: city or regional wage taxes, surcharges, church taxes, payroll or training levies, accident insurance, turnover or stamp taxes.
It is possible that some layers are fixed amounts rather than rates.

Worked example — hourly basis. Illustrative rates (or fixed amounts), no audit meaning.
The same case as the annual example, computed on hourly amounts throughout. Both paths reconcile to two decimals.

Baseline

Input	Value
Median gross annual earnings (rung 1)	40,000.00
Standard working hours	1,920
Hourly gross salary (40,000.00 ÷ 1,920)	20.83

Up to consumer price — identical for both profiles

Step	Per hour
Hourly gross salary	20.8333
+ Employer-side mandatory costs (15%)	3.1250
= Salary pool	23.9583
+ Revenue-based corporate tax (1%)	0.2396
= Service rate	24.1979
+ VAT / GST / sales tax (10%)	2.4198
= Total consumer price	**26.6177**

* See Scope of each line below.

Down to net income — personal tax determined annually, then ÷ 1,920

Step	P1 single	P2 married, 2 children
Hourly gross salary	20.8333	20.8333
− Employee-side mandatory costs (15%)	3.1250	3.1250
− Personal income tax (after allowances and credits) annual 7,200.00 / 3,600.00	3.7500	1.8750
= Final net income	**13.9583**	**15.8333**

* See Scope of each line below.

Division

Step	P1 single	P2 married, 2 children
Total consumer price	26.6177	26.6177
Final net income	13.9583	15.8333
SSR = consumer price ÷ net income	26.6177 ÷ 13.9583	26.6177 ÷ 15.8333
SSR	**1.91**	**1.68**

P1 works 1.91 hours to buy one hour of the same work/service; P2 works 1.68.

Scope of each line. Each percentage in both tables above is a category, not a single tax. Include every mandatory layer that applies at the location — on employment and on the purchase — at every level of government, listed separately. What counts is that payment is non-optional, not what it is called: city or regional wage taxes, surcharges, church taxes, payroll or training levies, accident insurance, turnover or stamp taxes.
It is possible that some layers are fixed amounts rather than rates.

Checks

C1 — Published, on cadence, current (prevents: no series, or one describing a system that no longer exists)
Check: Are both profiles published as a standing statistic, at least annually, newest edition under 12 months old and updated within 90 days of the last statutory change?
How: Statistics or finance portal, open-data catalogue, budget report; compare stated cadence to the last three dates, and the law registry for changes since.
MEETS: both profiles present; three cycles on schedule or delays logged; newest period within 12 months; changes reflected within 90 days.
GAP: absent, one profile only, or press item only; unexplained gaps; older than 12 months; a changed layer with no revised figure.

C2 — Reachable (prevents: technically published, practically unreachable)
Check: Can anyone retrieve the figures and their fields without cost, registration or tracking?
How: Attempt retrieval and a bulk export.
MEETS: free, no login, no tracking; downloadable; stable location across periods.
GAP: paywall or login; image or non-extractable dashboard; single-record viewing only; entry point moves each period.

C3 — Method stated (prevents: a different calculation under the same name)
Check: Are the derivation sequence, profile definitions, rate basis, local adaptation and methodology version published?
How: Read the methodology against the sequence above; compare the version marker to the previous period.
MEETS: all five present; where the version changed, both bases published for one overlapping period.
GAP: headline figures only; sequence or rate basis unstated; profiles undefined or inconsistent; adaptation applied but undescribed; method changed with no marker.

C4 — Nothing omitted (prevents: correct on what it includes, silent on what it leaves out)
Check: Is every layer and relief item itemised, at every level of government?
How: Walk the derivation, confirming rate, amount and legal basis per line; cross-check the jurisdiction's own schedules.
MEETS: each layer and relief item separate; refundable relief split at zero; sub-level taxes included with the convention stated; non-applicable items shown as zero with a reason.
GAP: a layer or relief item missing; a cash transfer in net income; refundable excess counted; items aggregated beyond decomposition; an item in the statutes absent from the publication.

C5 — Inputs correct, figure reconciles (prevents: correct arithmetic on wrong inputs)
Check: Does each input match a named dated source for the claimed period and territory, and does recomputation reproduce the SSR to two decimals?
How: Open each source and confirm value, period and rung; confirm normalisation and the 1,920 divisor; recompute both profiles; compare prior periods to archived editions.
MEETS: inputs retrievable and matching; rung and territory stated; thresholds taken from the annual amount; recomputation reconciles; consumer cost identical across profiles; prior periods unchanged, corrections dated; QA recorded independently of the producing unit.
GAP: unattributed or mismatched inputs; period mismatch; rung undeclared; wrong or unstated divisor; thresholds taken from the hourly figure; no reconciliation; consumer cost differs between profiles; archived figures silently changed; QA absent or internal.

Operational Note: review the Disclaimer (D53) before deployment.

Category 7: Environmental Integrity

22. Land Surface and Habitat Transparency Safeguard [AUDIT EFFECT]

Extension ID: D32-R22-EXT

ENTRY

What is measured. How the Organization's whole territory divides between 17 surface classes and 4 holder groups, how each changes per period, and 5 ratios: reversibility, carbon, heat load, undisturbed habitat, and their mean. Per reporting unit, as a series. Headline: the sealed share and its net change.

What it gives an Owner. How much of my district is built over, and how much was 10 years ago. How much forest was lost here last year. Who holds the land: the state, companies, or nobody on record. Whether land called protected is protected from access or only from development. Areas and shares, checked by adding rather than modelling, for the place the Owner lives in, not as a national average.

Why measured this way. Many figures come from registers the Organization already keeps or standards it already reports to: cadastre and property-tax roll, road and rail registers, designation records, the land-use tables of its greenhouse gas inventory (IPCC 2006 Guidelines), its national accounts sectors (SNA 2008), and the extent-account format of the UN SEEA Ecosystem Accounting (2021). Nothing has to be surveyed or bought. Without a complete register the Organization estimates and says so. Factors are fixed here, because a factor chosen after seeing one's own areas is not a standard. They are a convention, not physical constants; areas are published beside them, so any ratio can be recomputed on other factors.

No position is taken. A falling forest share is not a failure and a rising sealed share is not a pass. Nothing here obliges any land-use decision.

Reporting unit = the territory, and each administrative unit directly below it.

Territory = land area plus inland waters (FAO definitions), as administered, in km². Territorial sea is excluded. Territory claimed but not administered is a memo line with the instrument of the claim, outside every sum and ratio; where a boundary is not agreed, the line used is named. This is a counting convention, not a position on any claim.

No exemptions. Every km² is counted once, in 1 class and 1 holder group, whatever its use or status: military, security, commercial, customary or disputed. A sensitive site is counted in the totals; only its location may be withheld, as a stub naming the standard used. Ice and rock count like forest and road: a city rarely holds them, a country may, a continent does, and an account that drops a surface cannot be added to one that keeps it.

Area = vertical projection (map area), never inclined ground. Where surfaces stack, the one open to the sky counts: a bridge is road; a road in a tunnel is not counted. Nothing below ground adds area.

DATA SPECIFICATION

Classes. 17, listed with their factors under "Factors and ratios". Each maps to 1 IPCC land category, so the account reconciles with the land table of the greenhouse gas inventory. Forest follows the FAO Forest Resources Assessment definition (over 0.5 ha, trees over 5 m, canopy over 10%). Classes follow the surface, never altitude: puna, alpine meadow and tundra stay in their vegetation class. Unbuilt ground inside parcels and urban green are classed by cover: lawn and park grass as grassland; trees as forest where they meet the FAO definition, else as other woody vegetation.

Area from length. Road, sidewalk and rail registers hold length: area = length × standard width from the Organization's own design standard, with the width table published.

Holder groups. By holder of title, not user, lessee or concessionaire, in the national accounts sectors (SNA 2008):

- **G1 State:** general government and public corporations, plus land vested in the state by statute without title.
- **G2 Companies:** private corporations, including cooperatives.

- **G3 Other organizations:** non-profit institutions serving households; land under communal or customary title, shown as "of which communal or customary".
- **G4 Private:** households (natural persons, alone or jointly).
- **Not recorded:** no holder in any register. Its own column, never distributed.

Co-held land is split by recorded shares, else equally. Who stands behind a holder is Right 19.
Account. Per reporting unit and for the Organization: 1 matrix, 17 classes × 4 groups + not recorded; rows and columns summed; total = territory. Change in the SEEA extent-account format: opening area, additions, reductions, closing area, per class and per group. Only the flow shows the direction, and the direction is what a decision can still act on.
Provenance. Every figure marked measured, derived (naming its inputs) or estimated (naming method and error band); an unmarked figure is not published. An estimate within 10% shows position and direction; without it neither is visible. The method is held constant; a change is dated and the prior series stays as recorded.
Headline. Sealed share = the 7 Settlements classes ÷ territory, with its net change. A plain share, never combined with anything.

Factors and ratios

Factor vector: 1.0 · 0.5 · 0.25 · 0.125 · 0.0. Each rung halves the one above; the last is zero: nothing left to count. A ratio therefore moves most when land leaves the top rung.
Weighted area and ratio — the result this Right produces.
For each of A1 to A4, every km² (or mi²) of the territory sits on exactly 1 rung.
With a1 to a5 = the area on rungs 1 to 5:
{**weighted area**} = a_1 * 1.0 + a_2 * 0.5 + a_3 * 0.25 + a_4 * 0.125 + a_5 * 0.0
ratio = **{weighted area} / territory**
territory = a_1 + a_2 + a_3 + a_4 + a_5

$$\text{weighted area} = a_1 \times 1.0 + a_2 \times 0.5 + a_3 \times 0.25 + a_4 \times 0.125 + a_5 \times 0.0$$

$$\text{ratio} = \frac{\text{weighted area}}{\text{territory}} \qquad \text{territory} = a_1 + a_2 + a_3 + a_4 + a_5$$

The 5 areas add up to the territory and no factor exceeds 1.0, so each ratio is always between 0.0000 (all land on rung 5) and 1.0000 (all land on rung 1). Ratios are published to 4 decimals: a year of change in a large territory often moves only the third or fourth.
Both figures are published per unit. Given the class areas from a land register, nothing more than this formula is needed: by hand, in a spreadsheet or with a prompt. Weighted areas, unlike ratios, can be added across units and Organizations or territories.

A5 Combined = (A1 + A2 + A3 + A4) ÷ 4, from the published 4-decimal values, rounded half up to 4 decimals. Each of A1 to A4 lies between 0.0000 and 1.0000, so A5 does too. A5 exists so that no administration can present its best ratio and leave out the others; equal weights are a convention. A5 sits beside A1 to A4, never in their place.

Rungs. What places a surface on each rung, per ratio:

Factor	A1 Reversibility: what must go before the land returns to open use	A2 Carbon: stored and absorbed per area	A3 Heat load: surfaces that do not return the day's heat at night	A4 Undisturbed: human presence the designation permits
1.0	nothing	forest, peatland	canopy, water, wetland, ice	IUCN Ia–Ib
0.5	an installation that comes off	other vegetation and water	other vegetation	IUCN II–III
0.25	a sealed surface layer	cropland	cropland	IUCN IV
0.125	a structure	pre-development land	pre-development land	IUCN V–VI
0.0	contamination or a hazardous installation	bare, ice, sealed	anything else	not designated or no category

In A2, forest is 1 rung: no register separates tropical from boreal; the inventory's measured removals carry that difference. A4 follows the IUCN category as reported to the World Database on Protected Areas; where designations overlap, the strictest counts, once.

Class	IPCC category	A1	A2	A3
Street and road	Settlements	0.25	0.0	0.0
Highway	Settlements	0.25	0.0	0.0
Sidewalk and paved area	Settlements	0.25	0.0	0.0
Rail	Settlements	0.25	0.0	0.0
Buildings	Settlements	0.125	0.0	0.0
Industrial site	Settlements	0.125	0.0	0.0
Landfill and depot	Settlements	0.125	0.0	0.0
Cropland	Cropland	1.0	0.25	0.25
Grassland, pasture, lawn	Grassland	1.0	0.5	0.5
Other woody vegetation and bush	Grassland	1.0	0.5	0.5
Forest	Forest land	1.0	1.0	1.0
Wetland	Wetlands	1.0	0.5	1.0
Lake and reservoir	Wetlands	1.0	0.5	1.0
River	Wetlands	1.0	0.5	1.0
Permanent ice, snow and glacier	Other land	1.0	0.0	1.0
Bare rock and scree	Other land	1.0	0.0	0.0
Bare and other land (desert, sand, sparse)	Other land	0.5	0.0	0.0

Overrides, each published by class; where several apply, the lowest factor:

- **O1** Contaminated (contaminated-land register; else "no register") or hazard-restricted (Right 25 site): A1 0.0.
- **O2** Peatland: A2 1.0.
- **O3** Permanent woody crops (orchard, vineyard): A2 0.5, A3 0.5.
- **O4** Unsealed ground under solar, trellis, wire or polytunnel: classed by ground cover; A1 0.5.
- **O5** Pre-development land (zoned or permitted for building, unsealed): A2 0.125, A3 0.125.
- **O6** Lightweight structures without foundations: A1 0.25.

Idle sealed surface. Of the sealed total, the area vacant, derelict or out of use, with its duration: the only land returnable without displacing a use.
Own instruments. Any target, levy, incentive or programme the Organization has adopted that bears on these figures, with its instrument and effective date; else "no instrument stated". This Right proposes none.
Aggregation. Obliged on no one, arithmetic for anyone: sum areas and weighted areas, then divide; never average ratios. X: 70 ÷ 100 = 0.7000; Y: 150 ÷ 300 = 0.5000; together 220 ÷ 400 = 0.5500, not 0.6000. A ratio compares a unit with itself over time, or with units of like type, density and terrain.

Publication and checks
Where already held (else "not held"; none is a precondition): visitor and livestock numbers beside the IUCN category, because permitted use is not actual use; sealed surface by reflectance and by drainage (to soil or to sewer); net CO2 removals from the greenhouse gas inventory; land surface temperature.
Cadence: annual; calendar year, stocks at 31 December, as in the inventory; first account within 12 months of the first request. **Retention:** 25 years minimum; corrections as dated revisions, never edits. **Format:** free, no registration, no tracking; bulk download in an open format, stable identifiers; definitions in files without commentary.

WHAT TO PRODUCE
Filed under Document 40 with: right number and title; failed checkpoint (e.g. R22-C3); unit, class, holder group and period; where looked for; retrieval date. Label note: [AUDIT EFFECT] — remedies apply only to Request Not Handled under Document 40. These checks establish the facts a request states.

CHECKS
C1 — Published, current, reachable (an account held internally, or only a map viewer)
- Check: Every unit published, newest under 12 months, bulk, free, no login?
- How: Statistics office, cadastre, planning ministry, open-data catalogue; compare the last 3 editions; try a bulk export.
- MEETS: All units; cadence met or delays logged; free bulk export in an open format.
- GAP: Absent; national total only; over 12 months old; paywall or login; viewer or chart only.

C2 — Whole and reconciling (an account with a gap cannot be added to another)
- Check: Are all 17 classes and 5 holder columns present per unit, in km², summing to territory, with nothing withheld and claimed land outside?
- How: Add the matrix both ways; compare with the territory figure and the inventory's land table; read stubs and memo line.
- MEETS: All present; sums reconcile; IPCC totals match or the difference is explained; withholding at site level only.
- GAP: A class or group absent or merged; ice or rock left out; an area withheld whole; a residual absorbed; not-recorded land distributed; holder taken from user, not title.

C3 — Provenance marked, flow published (a series that moved because the method moved)
- Check: Is every figure marked, the method stable, and the extent account (opening, additions, reductions, closing) published per class and group?
- How: Read the markers; compare method statements across editions; retrieve an archived figure.
- MEETS: Every figure marked; estimates name method and error band; width table published; method changes dated; prior figures unchanged.
- GAP: Unmarked figures; method changed silently; back-series recomputed; net change only for the total.

C4 — Ratios recomputable and addable (a ratio without the areas behind it)

- Check: Are A1 to A5 published over territory, with class, override and weighted areas, and do they recompute to 4 decimals?
- How: Recompute from the published areas and fixed factors; add 2 units' weighted areas and compare with the Organization's ratio.
- MEETS: All 5 present; factors and overrides as fixed here; recomputation and unit sums reconcile; headline published plain.
- GAP: A ratio absent; a surface outside the denominator; factors altered; weighted areas missing; A5 without A1 to A4 beside it; headline combined.

C5 — Hazard, contaminated and idle sealed present (unusable land left invisible)

- Check: Are the 3 lines published, and does hazard area join the Right 25 register?
- How: Read the 3 lines; join by site identifier.
- MEETS: All 3 per unit; join works; idle sealed with duration; "no register" stated where none exists.
- GAP: A line absent; join fails; no duration; "no register" asserted where one exists.

C6 — Habitat classified, use stated (permitted use shown as actual use)

- Check: Is protected area published by IUCN group, with use intensity where records exist?
- How: Compare with the designation records and the World Database on Protected Areas; look for fee, permit and census records.
- MEETS: All 5 groups, overlaps counted once; use intensity or "not held".
- GAP: 1 protected total; categories not matching; overlaps counted twice; "not held" where records exist.

C7 — Joinable as a series (a record that can be viewed but not analysed)

- Check: Is the full record downloadable and joinable across periods and units by a stable identifier?
- How: Download; join 2 non-adjacent periods and 2 units.
- MEETS: Bulk, machine-readable; identifiers stable; definitions in files without commentary.
- GAP: View-only dashboard; charts only; identifiers reassigned; definitions only in narrative.

Operational Note: review the Disclaimer (Document 53) before deployment.

23. Open Access to Global Warming-related Data [AUDIT EFFECT]

Extension ID: D32-R23-EXT

ENTRY

Specifies the environmental measurement record: which quantities, from which stations, at what cadence, and how an Owner tests that it is complete, located, current and unaltered.

A changing climate reaches an Owner as local conditions, and that is the only level at which an Owner can respond — what to build with, what to plant, where to live, whether to insure. Those decisions are slow and hard to reverse, so they need readings for the place and a series long enough to show direction.

All of it is already measured. Meteorological services record air and soil temperature, radiation and precipitation to international standard; hydrological services record water; road authorities record pavement temperature for winter maintenance; and the archives run back decades. What is missing is publication: the readings sit in separate agencies, in separate formats, and an Owner cannot assemble them. This right specifies no new instrument, no new observation programs and no reprocessing of existing records. It requires that what is already held be published centrally, at station level, as a retrievable series — the obligation R17 places on statistics, applied to measurements.

These checks take no position on cause, attribution, trend direction or any policy response. A rising series is not a failure and a flat one is not a pass. Nothing here obliges the Organization to act on any figure or restricts what it may build.

Station = a fixed measurement point with published coordinates and a stable identifier.

Climatological day = the declared 24-hour window over which daily minimum and maximum are taken.

Revision entry = a dated record of what changed, why and when, published beside the figure it corrects.

DATA SPECIFICATION

Scope of the obligation. Every domain below is already observed by the Organization or a body it funds, and every one carries an existing archive. The obligation is publication of what is held.

Domains. Measurement points and methods follow the international standard where one exists; a station already meeting that standard acquires no new obligation. Values may be published in the Organization's customary unit, declared once and held unchanged.

Air temperature — at the station's established screen height, within the WMO range 1.25–2.0 m, declared per station. *Not a fixed height: services differ within the range, and imposing one number would disqualify the longest series this right exists to surface.*

Soil temperature — 5 cm and 20 cm below surface, bare level ground, at urban, forested and agricultural stations. *Both WMO standard depths, so existing series qualify unchanged. 5 cm carries the daily cycle; 20 cm is the root zone a planting decision turns on.*

Soil moisture — same two depths.

Global solar radiation — downward shortwave at the surface. *The input to every surface reading here: a hot pavement without it records that a surface was hot, never why, and material choice acts on absorbed shortwave.*

Humidity — relative humidity and dewpoint at the declared screen height. *Both derive from one measurement; relative humidity alone cannot compare heat stress across temperatures.*

Precipitation — accumulated depth per station.

Sealed-surface temperature — unshaded pavement reading at road-weather stations operated for winter maintenance: urban, suburban, rural. *Held by road authorities, which is why it is absent from climate portals despite existing. Shaded air temperature does not record the heat a sealed surface holds — the exposure an urban Owner lives in.*

Water temperature — primary rivers: single reading at the service's established depth. Major lakes and coastal sea where applicable: the profile depths the operating service already records, declared per station.

Upper air temperature — 850 hPa and 300 hPa, as reported by radiosonde. *Archived by pressure level, not altitude; a height specification names a figure no network holds.*

Ozone column — Dobson Units, total column, at the national network's stations. *National scope: the instrument network is national, not local.*
Coverage. Every station operated, funded or licensed by the Organization appears in the register and the record, whichever agency holds it. A station excluded is named with the reason.
Why completeness rather than a station count: this right adds no stations, so the only testable coverage question is whether the existing network is published whole. Selective publication is otherwise indistinguishable from thin coverage.
Cadence. Per station: hourly values where the station produces them, otherwise the resolution held, declared per station. Daily minimum and maximum over the declared climatological day. Upper air at the service's ascent times, conventionally 00 and 12 UTC.
Why the declared day rather than fixed clock readings: services compute min and max over different 24-hour windows, and two records cut at different boundaries cannot be compared. The boundary matters; which boundary does not.
Why hourly: it is standard archived output, and any coarser figure derives from it while the reverse does not.
Station register. Per station: identifier, coordinates, elevation, installation date, instrument type, surroundings class, screen height, climatological day, reporting resolution, operating agency. Identifiers stable for the life of the station.
Metadata over restatement. Where a method, screen height, instrument, climatological day or station location changed, the change is published in the station history with its effective date. The prior series is published as recorded and is never recomputed.
Why: the archive is publishable as it stands only if nothing must be reprocessed first, and a recomputed historical figure is a retroactive edit of the kind this right exists to make detectable. A disclosed discontinuity is auditable; a silent one is not.
Lag. Within 24 hours of capture. Interruptions logged with date, scope, reason and restoration time. *Without the log, a gap and a suppression are indistinguishable.*
Retention and immutability. The full held archive is published, whatever its depth. Readings older than 30 days held in a non-rewritable archive — WORM, object-lock, append-only, or published release hashes with independent timestamping. Corrections as revision entries beside the original, never edits. *The archive is not created here; it is already held. What is required is that it stay retrievable and unaltered.*
Format. Free; no registration; no tracking. Bulk download of the full record in an open machine-readable format, joinable across years by station identifier. Measurements and definitions retrievable in files containing no commentary. *A dataset that cannot be obtained without its interpretation is a publication, not a record.*

WHAT TO PRODUCE
Filed under D40 with: right number and title; failed checkpoint (e.g. R23-C4); domain, station and period concerned; where looked for; retrieval date.
Label note: [AUDIT EFFECT] — remedies apply only to Request Not Handled under D40. These checks establish the facts a request states.

CHECKS
C1 — One reachable record (data held by several agencies and assembled by none)
Check: One official location holding all domains from every contributing agency, without fee, registration or tracking?
How: Meteorological service, hydrological service, road authority, open-data catalogue; retrieve without an account.
MEETS: One entry point covering all domains; free; no login; no tracking.
GAP: Split across agency sites; login, payment or consent required; on request only; a domain reachable only from its originating agency.
C2 — All domains present, at declared resolution (a record complete except for the domain in question)
Check: Every domain published at the stated points, with the station's reporting resolution and daily

min/max over a declared climatological day?
How: Walk the domain list against the current release; read the register for resolution and day boundary.
MEETS: All domains present; resolution and climatological day declared per station; non-applicable domains stated with a reason.
GAP: A domain absent; a standard depth or pressure level missing; min/max with no declared day; resolution undeclared.

C3 — Network published whole (a curated subset presented as the network)
Check: Does the register list every station the Organization operates, funds or licenses, with exclusions named and reasoned?
How: Compare the register against the operating agencies' own published station lists.
MEETS: Register matches the agencies' lists; exclusions named with reasons.
GAP: Stations in an agency list absent from the register; register covering one agency only; exclusions unexplained.

C4 — Stations identified, changes documented (a series that moved because the station moved)
Check: Are coordinates and stable identifiers published, and is every change of location, instrument, screen height or climatological day recorded in the station history with its effective date?
How: Compare the current register and station histories against the previous release; check identifiers across years.
MEETS: Coordinates present; identifiers unchanged; every change carries a dated history entry.
GAP: Coordinates absent or vague; identifiers reassigned; a station moved, re-instrumented or re-cut with no history entry.

C5 — Current (a record arriving too late to act on)
Check: Data published within 24 hours of capture, interruptions logged?
How: Compare capture to publication timestamps over the last 30 days.
MEETS: 24-hour lag met; every gap carries a log entry.
GAP: Lag routinely exceeded; gaps with no entry; delays clustering on extreme events.

C6 — Archive published whole and unaltered (an archive that is held but not published, or silently revised)
Check: Does the published series reach as deep as the agency's stated holdings, and do prior readings match earlier releases?
How: Compare published depth against the agency's own statement of holdings; retrieve an archived reading and compare against its current value.
MEETS: Published depth matches held depth; archive method stated; prior readings unchanged or changed with a revision entry.
GAP: Published series shallower than stated holdings with no reason; broken historical access; a prior reading now different with no entry.

C7 — Processable as a series (a record that can be viewed but not analysed)
Check: Full record downloadable as open-format files and merged across years by station identifier?
How: Use the download control; join two non-adjacent years on identifier.
MEETS: Bulk export; machine-readable; identifiers join across years; stable location.
GAP: View-only dashboard; aggregated charts only; export capped; throttled; identifiers not joinable.

C8 — Measurements separable from commentary (a record obtainable only with its interpretation)
Check: Measurement files and data dictionary retrievable without commentary in the same file?
How: Open the downloaded files; inspect labels and headers.
MEETS: Measurements, units and definitions only; labels technical and unchanged between periods.
GAP: Commentary embedded in the data files; labels carrying framing; field names altered with no entry.

Category 8: Economic Risk Governance

25. High-Risk Industry Insurance Safeguard [AUDIT EFFECT]

Extension ID: D32-R25-EXT

Entry

Some activities can cause harm far larger than the operator could ever pay for. A dam, a chemical plant, a containment lab, a tunnel. When the worst happens, the company often does not survive the accident. The people living nearby do not get that option: they carry the injuries, the illness and the deaths, and whatever money is owed afterwards comes from the budget, which is to say from the Owners.

A release, a collapse or a contamination event does not stop at the fence, and moving away is not a choice most people have. Where there is no exit, the only remaining check is seeing what is there.

Insurance is the one arrangement that still pays after the operator is gone. It does not undo anything. But it is the difference between a family that is compensated and a family left waiting for a government decision that may never come.

An Owner cannot read a private insurance contract. So this extension specifies a public list: what it must contain, how current it must be, and how an Owner checks it.

Who does what. The Organization publishes the list: which activities are on it, and whether any are missing. Each operator publishes the cover for its own site. A finding goes to whichever of the two failed.

What is not tested here. Whether a sector should be insured. Whether an insurer is sound. Whether the worst-case figure is correct. The extension tests two things only: is the cover published, and does it reach the minimum floors below.

Three words insurers use. Before setting a limit, an insurer has to put a number on how bad it could get. There are three ways to answer, and they give very different numbers.

Picture a fuel storage site. One tank catches fire.

PML — Probable Maximum Loss. Everything built to contain the fire holds. The walls around the tank keep the burning fuel inside. The fire system starts. The fire brigade arrives in time. One tank is lost. This is the realistic bad day.

MPL — Maximum Possible Loss. Nothing holds. The walls fail. The fire spreads to the tanks beside it, then crosses the fence into the streets behind. This is the worst damage the site is physically able to cause. It is not the most likely outcome, but it is possible.

EML — Estimated Maximum Loss. An engineer looks at this one site and decides which safety measures to count on and which to ignore. The result usually falls between the other two figures.

MPL is always the biggest number, often many times the others. An entry that publishes PML and calls it the worst case is not lying, but it is answering an easier question. That is why the method has to be named next to the figure.

What the list covers

Published by the Organization.

Named activities: power generation, including hydro, fossil-fuel and nuclear; chemical production and hazardous materials; biological containment; mining and heavy industry; rail, metro, road, air, sea and inland waterway transport systems, including freight; dams, bridges, tunnels; pharmaceutical manufacturing; launch and space operations; large energy storage; bulk food and water supply.

Defense: munitions, nuclear weapon components, chemical or biological agents, military space infrastructure.

Anything else where the worst case is bigger than the operator. If a documented worst-case loss estimate exceeds the operator's own net assets, the activity goes on the list whatever sector it is in.

Why this line: below it the operator can pay. Above it, somebody else pays, and that is the situation this right exists for.
Nothing open-ended. An activity is named, caught by the rule above, or published as an exclusion with a reason.

What each entry must say
Published by the operator of the site.

1. Site identifier; location by district
2. Operator legal name; ownership reference (R19)
3. Category, or "other" with the loss figure that triggered it
4. Insurer legal name; policy reference; start date; expiry date; active or expired
5. Coverage limit, per accident and in total
6. Phases covered — design, construction, operation, after closure — each yes or no
7. Who carries design and construction liability now, if the original builder no longer exists
8. Worst-case loss analysis: reference; date; method named; return period; figure
9. Sum insured per life lost; with its SDR conversion and the rate date; the Life Cover Ratio.
10. Why this insurer can be trusted to pay: home regulator and license, or financial-strength rating and agency, or documented reinsurance or capital guarantee
11. Whether victims can claim directly from the insurer, or only through the operator

On point 8: the return period is how rare an event the figure describes. It must be at least one in fifty years. A shorter period leaves out the accidents this right exists for, and makes the figure look smaller than it is.
On point 11: this is the one that matters most after a bankruptcy. A policy normally pays the operator back after the operator has been sued. If the operator no longer exists, that chain breaks at the first link. Only a policy that lets an injured person claim against the insurer directly still works.
Defense entries may reduce point 1 to region and withhold point 8. Everything else is published. The Owner funds the exposure either way; what is protected is the location and the loss model, not the fact that cover exists or who carries it. Each reduced entry appears as a stub naming the standard used. Nothing else may be withheld, and age is never a reason to withhold.
Where no list exists, the operator publishes these eleven points itself, on its own site, in the same format.

Completeness
The Organization's obligation.
The list is compared against the national register of licensed hazardous installations. Both counts are published. A license with no entry is a gap.
If no national register is published, that absence is the finding.

Cadence, retention, format
The Organization sets the list's cadence and format. The operator meets it for its own entry.
Cadence. New entry within 30 days of a license or a policy starting. Status updated within 7 days of expiry — an expired policy is a live uninsured site, and a quarterly cycle would leave that unknown for up to 90 days. Full refresh at least quarterly.
Retention. Old entries kept for 25 years or the life of the structure, whichever is longer. Defects surface decades later, and a list that overwrites itself cannot show who was covered when the defect was built in. Corrections published as dated entries.
Format. Free, no registration, no tracking. Sortable by category, operator, insurer, status and expiry date. Downloadable in bulk as CSV or JSON. A list you can only read one entry at a time cannot answer the question that matters: what is uninsured right now.

Two floors
Cover against the worst case
Coverage Ratio = total limit ÷ worst-case loss figure, both from the same entry, two decimals.
The ratio is a plain number with no currency, so entries compare across countries without conversion.

The floor is 5%. Cover should reach at least one twentieth of the modelled worst case.
The floor is set low on purpose. A bar nobody can clear gets ignored, and then it measures nothing. This one is low enough to be reached and high enough that falling below it means the cover cannot absorb a severe accident at all — the rest falls to the Owners by default.
The floor is a minimum, not a target. Higher cover is better, and the published ratio shows how much higher.

Cover per life
There is already an international floor for this. The Montreal Convention of 1999, which about 140 states have signed. The airline is liable for that amount whether or not anyone proves fault, and the figure is reviewed every five years for inflation by the International Civil Aviation Organization. Since December 2024 it has stood at 151,880 SDR, an International Monetary Fund unit that converts into any currency.
The floor is 151,880 Special Drawing Rights per life lost, or the current Montreal Convention figure, whichever is higher. Fixed rather than scaled to local earnings, it prices every life the same: roughly three years of median earnings in a wealthy country and roughly thirty in a poor one.

Why fixed. A floor set against local earnings is lowest exactly where an Owner's other protections are weakest, and it moves whenever the median moves or the territory is reselected. An SDR figure is published daily by the IMF and revised on a published five-year cycle by ICAO, so it needs no national statistics office — the check runs in every jurisdiction, including those that publish no median at all.

It is a minimum, not a valuation, and not compensation. It is the amount that exists in advance, so that a family is not left waiting for a government decision after the operator has gone.
Where law or treaty already requires more, the higher figure stands. Life Cover Ratio = sum insured per life ÷ 151,880 SDR (or the current Montreal figure), two decimals. Like the Coverage Ratio above, it is a plain number with no currency, so entries compare across countries without conversion. The floor is 1.00. Below it, the ratio records how far below — a bar that is missed is still measured.

What to produce
Collect as you go. A finding filed under D40 carries: Right 25 and its title; which check failed; whether it goes to the Organization or to the operator; where the list was published and the date you read it; the site or license concerned; and a copy of the entry, or of its absence.
Checks A1 to A3 are the Organization's. Checks B1 to B9 are the operator's.
For this [AUDIT EFFECT] right the only substantive failure is how the request is handled under D40.

Checks

Part A — the list (the Organization)

A1 — One public list, free to open *(stops: cover you can only verify by asking)*
Check: Is there one public list of insurance for high-risk sites?
How: open-data catalogue; hazard regulator; licensing authority.
MEETS: one place; free; no registration; searchable.
GAP: scattered across agency pages; login, fee or tracking required; "available on request."

A2 — Every risky site is on it *(stops: a list that looks full but misses sites)*
Check: Does every licensed hazardous site have an entry?
How: national licensing and permit registers; environmental permit lists; operator annual reports.
MEETS: both counts published and matching; gaps listed; an independent completeness check published.
GAP: counts not compared; a license with no entry; no national register published; a completeness claim with nothing behind it.

A3 — It says what it leaves out *(stops: a sector excluded by never being mentioned)*
Check: Are the covered categories published as a closed list, with the "worst case bigger than the operator" rule and any exclusions?
How: the list's scope or method page.
MEETS: closed list; the rule published; each exclusion named with a reason.
GAP: "including but not limited to"; a comparable-risk sector missing with no reason given.

Part B — the entry (the operator)

B1 — The entry answers the questions *(stops: an entry that names a policy without saying what it covers)*
Check: Does the entry carry all eleven points?
How: open the entry for your site in the public list, then ten more across different categories.
MEETS: all eleven, or points 1 and 8 reduced under a published defense stub.
GAP: any point missing; limits described as "adequate" or "as required by law."

B2 — Cover shown as active really is *(stops: expired cover displayed as current)*
Check: Does the status match the expiry date, and is the entry refreshed on time?
How: in the entry, compare the expiry date against today, and read the last-updated stamp.
MEETS: no past expiry date still marked active; refreshed within 90 days.
GAP: either.

B3 — The limit sits next to the loss it is meant to cover *(stops: a number with no basis)*
Check: Does the entry show the coverage limit, the worst-case figure, the method name, the return period and the analysis date?
How: in the entry, the coverage limit beside the worst-case analysis.
MEETS: all five present.
GAP: any missing; analysis undated; method unnamed; return period shorter than one in fifty years.

B4 — Cover reaches the 5% floor *(stops: a policy too small to matter)*
Check: Is the Coverage Ratio 0.05 or higher?
How: divide the total limit by the worst-case figure, both from the entry.
MEETS: 0.05 or above.
GAP: below 0.05. Also GAP where no worst-case figure is published — an entry cannot pass this check by staying silent.

B5 — It says which phases are covered *(stops: cover for operation only, presented as full cover)*
Check: Are all four phases marked yes or no?
How: in the entry, the four phase marks.
MEETS: four explicit marks.
GAP: phases unmarked, or described only in prose.

B6 — Someone still carries the builder's liability *(stops: the liability vacuum when a contractor dissolves)*
Check: Where design or construction is covered, is a current carrier named?
How: in the entry, the named carrier; then search the company register to see whether that company still exists.
MEETS: a named party that still exists, or the operator's policy explicitly covering old design and construction defects.
GAP: blank; the named party is dissolved.

B7 — The insurer can be checked *(stops: a named insurer that cannot pay)*
Check: Does the entry give one of the three grounds?
How: in the entry, the stated grounds; then check the license in the named regulator's public register, or the rating on the agency's public list.
MEETS: regulator and license, or rating and agency, or documented guarantee.
GAP: insurer named with no grounds; a stated license not findable in that regulator's register.

B8 — Victims can reach the insurer *(stops: cover that dies with the company)*
Check: Does the entry say whether an injured person can claim against the insurer directly?
How: in the entry, the line on direct claims.
MEETS: stated either way.
GAP: not stated; or claims go only through the operator with no fallback named.

B9 — The sum per life reaches the floor *(stops: deaths left to a decision taken afterwards)*
Check: Does the entry publish a sum per life lost at or above 151,880 SDR or the current Montreal Convention figure, its Life Cover Ratio, and how beneficiaries are paid?
How: in the entry, the sum per life, the ratio and the payment route; convert at the IMF's published SDR rate for the stated date, and confirm the current Montreal figure with ICAO.
MEETS: sum, ratio and payment route present; Life Cover Ratio at or above 1.00.
GAP: any of the three missing; ratio below 1.00; a sum stated in a currency with no conversion date; or the sum given as a reference to a future decision rather than a figure.

26. Monopoly Power Transparency Safeguard [AUDIT EFFECT]

Extension ID: D32-R26-EXT

Entry
Specifies when a provider counts as monopoly-like, what it publishes about its prices and costs, and how an Owner tests it.
A customer who can leave disciplines a price by leaving. Where leaving is impossible — the water main, the grid, an owners' association you exit only by selling your home — that check is gone, and visibility is what remains. Harm needs no bad intent: waste, inefficiency and insider deals cost a captive customer the same. Legal form decides nothing. A non-profit can pass its surplus out through affiliates; a city-owned company can serve at cost. The same fields apply to every form.
Who does what. The Organization publishes the list of monopoly-like providers. Each provider publishes its own disclosure. A finding goes to whichever of the two failed. Where no list exists, a provider meeting the test publishes anyway.
What is not tested. Whether a price is fair, a surplus too high, or a contract justified. Every comparison below is recorded, never failed. The only failure is not publishing.

Qualification
A provider is monopoly-like for the Owners it serves if any one test applies:
Q1 Share. 50% or more of a market in the region, or 20% or more where the sector is fragile or tightly regulated (e.g. banking, health insurance).
Q2 No feasible alternative. No competitor within reach; switching needs unreasonable cost (e.g. own well, private wastewater); or a statute, concession or mandatory membership binds the Owner.
Q3 Non-substitutable. Opting out would seriously harm health, safety, housing, mobility or income, or require selling property.
Q4 Critical infrastructure. If it fails, nothing can absorb its demand within 180 days.
Market and share follow the competition authority's or sector regulator's published market definition; else the provider's annual report, method stated.

Definitions
Pricing group = any customer class with its own rates or terms (residential, business, internal, partner, legacy, VIP).
Special arrangement = any price that deviates from the published rates.
Layer = one step in a contracting chain: contractor 1, its subcontractor 2, and so on.
Wholesale reference = the published exchange, index or regulator price for the same input, region and period.

Data specification
The list (the Organization). One public register of providers meeting the test: name, sector, area served, test applied, source. A sector left out is named with the reason.
The disclosure (the provider):

1. **Cost and price per unit.** Per billing unit (kWh, m^3, month, as billed): what 1 unit costs the provider — input bought or produced, network and operation, levies, surplus — volume-weighted over the year. Per pricing group: rates, tiers, surcharges, discounts, eligibility; customers; volume; average price paid. Markup = group price ÷ unit cost, per group, never averaged across groups. Where costs are allocated differently between groups, the key is published. Why: a 5× markup on households disappears in a list price and in a blended average.

2. **Special arrangements.** Each under a non-personal identifier (e.g. "Group A", "local partner"), with its basis (volume, policy, regulatory order) and volume. No customer is named.

3. **Inputs.** For each core input (energy, fuel, water, bulk materials): price paid beside the wholesale reference, trailing 6 months; tender or direct award; supplier affiliated, yes or no.

4. **Surplus.** Revenue minus cost, as a ratio to cost, beside the regulator's allowed return where one is set, else the statistics office's figure for the sector. Where it went: retained, paid to owners or members, paid to affiliates (consulting, management fees, services, by count and value), or transferred to a parent body. Why: profit, surplus and transfer are names; where the money goes is the fact.

5. **Contracting chain.** For core services: number of contractors and subcontractors, number of layers, share of contract value at each layer.

6. **Service terms.** Guaranteed service levels and what is paid when one is missed; disconnection procedure and notice; penalty schedule.

7. **Price table.** Per pricing group, before discounts: price per unit, fixed charges per period, surcharges, and the all-in price per unit (total bill ÷ units) at low, typical and high household use, as the regulator or statistics office defines them; else as the provider states. Discounts listed separately. Why: a low unit price beside a high fixed charge is a high price.

8. **Price conditions.** Per condition: the rule, unit price before and after, step ratio (after ÷ before), threshold against a typical household's use, share of customers affected, and whether household size is counted. Why: a step inside a tier table is a price rise for whoever crosses it, and only the ratio shows its size.
Cadence. Annual. A price change is published at least 30 days before it takes effect (TCORF's own figure).

Retention. 10 years; corrections as dated revision entries, never edits.
Format. Free, no registration, no tracking; bulk download in an open format.

What to produce
Filed under D40 with: right number and title; failed check (e.g. R26-B3); provider, group or input concerned; where looked for; retrieval date.
Prefer aggregated pricing audits to individual ones, for safety and privacy. Shadow Audit is the default (D53, Section 4).
Label note: [AUDIT EFFECT] — remedies apply only to Request Not Handled under D40. These checks establish the facts a request states.

Checks
<u>Part A — the list</u> (the Organization)
A1 — Captive providers named (prevents: a monopoly no list admits)
Check: One public register of providers meeting the test, with the test stated?
How: Competition authority, sector regulators, open-data catalogue; compare with licensed sole operators.
MEETS: one free register; test and source per entry; exclusions reasoned.
GAP: no register; a licensed sole provider absent; test unstated.

<u>Part B — the disclosure</u> (the provider)
B1 — Cost beside price (prevents: a markup hidden in an average)
Check: Unit cost, its components and a markup per group published?
How: Recompute each markup from the published price and cost.
MEETS: all groups; markups recompute; allocation key where costs differ.
GAP: list prices only; 1 average across groups; components or key missing.

B2 — Exceptions shown (prevents: insider discounts)
Check: Special arrangements listed with identifier, basis and volume?
How: Add group and arrangement volumes, each counted once; compare with total volume sold.
MEETS: all listed; volumes sum to total.
GAP: no list; basis missing; volumes not summing.

B3 — Inputs priced against the market (prevents: overpaying a friendly supplier)
Check: Each core input shown beside a named wholesale reference, with award method and affiliation?
How: Compare with the reference series named.
MEETS: all core inputs, 6 months, reference named.
GAP: an input missing; reference unnamed; affiliation unstated.

B4 — Surplus traced (prevents: profit hidden behind a legal form)
Check: Surplus ratio, its comparison figure and every destination published?
How: Annual report or regulatory accounts; non-profit and publicly owned providers are tested the same.
MEETS: all three.
GAP: ratio without comparison; a destination missing or merged into costs; form cited instead of figures.

B5 — Chain mapped (prevents: margins stacked down a chain)
Check: Contractors, layers and value share per layer published for core services?
How: Read the chain; for a state-owned provider, compare with the R16 record.
MEETS: published, whatever the number of layers.
GAP: not published; layers unstated.

B6 — Terms stated (prevents: disconnection and penalties without rules)
Check: Service levels, compensation, disconnection procedure and penalties published?
How: Terms of supply, regulator's standards.
MEETS: all four.
GAP: any missing; "as required by law" instead of terms.

B7 — On time and kept (prevents: a price raised before anyone could read it)
Check: Price changes published 30 days ahead; 10 years retrievable; bulk download?
How: Compare effective and publication dates; retrieve an old tariff.
MEETS: all three.
GAP: shorter notice; archive gaps; view-only.

B8 — Price table (prevents: a unit price that hides fixed charges)
Check: List price, fixed charges and all-in price at low, typical and high use, per group?
How: Recompute the all-in price from the published charges.
MEETS: all groups, all three levels; recomputes.
GAP: unit price only; fixed charges missing; levels undefined.

B9 — Price conditions visible (prevents: a price that jumps for whoever crosses a line)
Check: Every condition with both prices, step ratio and share of customers affected?
How: Recompute each ratio; read thresholds against a typical household.
MEETS: all conditions, all fields.
GAP: tiers without ratios; customers affected unpublished; household-size rule unstated.

Recorded, never failed: an input above its reference, a surplus above its comparison, a transfer to a parent body, a group's markup far above another's, a group paying below the average others pay, a core service with more than 2 layers. Each is a measurement an Owner can state, not a breach.
Operational Note: review the Disclaimer (D53) before deployment.

27. Tariff Governance Safeguard [AUDIT EFFECT]

Extension ID: D32-R27-EXT

Entry
Two parts. (a) Stability audit: whether the Organization's tariff measures fit categories published in advance, are announced in advance with a domestic impact analysis, and stay unchanged for at least 365 days. (b) Proposal channel: a standard format in which an Owner may propose a tariff, or object to a premature reduction.
Why a price tag. Arguing and blaming end in bans and broken trade. A price tag on a named issue replaces open-ended conflict with a bounded cost, so trade continues. It also shows both sides where to start working together: resolving an issue lowers its price tag once the minimum period has run. This is a claim about the channel, not about outcomes. Cooperation starts from the overlap both sides already accept ("Diplomatic API", D10, Section 8).
Neither part evaluates whether a tariff is justified, necessary or correctly set.

Definitions
Tariff measure = an import surcharge on a jurisdiction, a sector or both, including its increase, reduction or removal.
Calibrated surcharge = a measured price friction, not a trade termination. It stays at least 365 days, and can end after that once the conduct has ended.
Reach into the Owner's country = the conduct's effect on its Owners' lives: wages, prices, jobs, assets, health, environment, public institutions, security.
Ad valorem equivalent = a rate expressed as a percentage of the goods' value; a per-unit duty is converted.
War of choice = as defined in R4.

Data specification — Part (a)
Categories. The Organization publishes the categories and bounds it uses to set tariff levels, at least 90 days before any measure is classified under them. A change to the categories is dated, kept beside the previous version, and published 90 days ahead. Part (a) tests measures against these categories, never against the tier scale in Part (b).
Registry. One public registry of active and past tariff measures. Per measure:

- registry ID
- counterparty jurisdiction
- scope, as Harmonized System codes or "general"
- purpose
- rate as ad valorem equivalent
- category
- evidence basis
- legal instrument and decision authority (office)
- announcement date; effective date; review or end date
- domestic impact analysis
- regional dispute mechanism used: yes / no / not applicable

Every modification is attached as a dated entry; nothing replaces the original.
Announcement. Every new measure and every modification is announced at least 90 days before it takes effect, with its parameters, effective date and domestic impact analysis: expected cost to consumers and to business inputs, in figures.
Stability. A measure stays in place at least 365 days, unchanged, whatever happens in that period (TCORF's own figure). Stability is the point: a rate that can move at will is not a price tag.

Integrated economic regions (e.g. EU, ASEAN, Mercosur, African Continental Free Trade Area). Where the counterparty is a member of the same region, the registry records whether the region's dispute mechanism was used.
Retention and format. 25 years; corrections as dated revision entries, never edits. Free, no registration, no tracking, searchable, bulk download in an open format.

Part (b) — Proposal channel
Tier scale. Tiers are a reference for Owner proposals, not a recommended schedule and not a test of the Organization's rates. The rate measures reach into the Owner's country, not gravity. Some of the gravest conduct sits in T1. A low rate is not a low judgement.
Decision rule. Answer every question. The highest tier answered YES applies. Where none is YES, the tier is T1.

Tier	Question	Rate cap
T1 — Mostly ethical	Default: no question below is YES. The conduct stays mostly inside the counterparty.	2%
T2 — Economic	Does the conduct reach the Owners' wages, prices, jobs, assets, health, environment or public institutions, directly or through traded goods?	10%
T3 — Security and economic threat	Is the conduct a military threat against the Owner's country, or a war of choice against a country bordering it?	50%
T4 — Major security threat	Is the counterparty waging a war of choice against the Owner's country?	100%

Examples. Not a complete list. Where an example and the decision rule disagree, the rule decides.

- **T1:** no free elections; restrictions on free speech; re-education camps; suppression of minorities.
- **T2:** goods made with forced or slave labour; state subsidies distorting competition; large-scale patent or trademark violation; nationalisation of assets owned by the Owner's country's Owners; cross-border environmental or nuclear harm; terrorism, drug production or drug trade reaching the Owner's country; migration disputes affecting the Owner's country; espionage or political interference; territorial disputes with the Owner's country.
- **T3:** military threats against the Owner's country; a war of choice against a bordering country. A war next door cuts trade flows and supply chains for goods and services, and can bring large numbers of refugees.
- **T4:** a war of choice against the Owner's country.

Evidence. A tier above T1 states how the reach was established: a court or tribunal ruling, a finding by an international body, or the Organization's own official finding. Reach that is only asserted is T1.
Proposal format. Filed under D40. In addition to the D40 request fields:

1. counterparty jurisdiction
2. tier and rate, within the tier's cap, as ad valorem equivalent
3. evidence basis: the conduct, its tier, the source type, and retrievable sources
4. for an objection to a premature reduction: the registry ID of the measure

What to produce
Filed under D40 with: right number and title; failed checkpoint (e.g. R27-A3); the measure's registry ID or the proposal's receipt number; where looked for; retrieval date.
Label note: [AUDIT EFFECT]. Each GAP in Part A is a TCORF non-compliance and a reason for a request. It obliges no change to any tariff. The only remedy is for a Request Not Handled under D40. In Part B, non-adoption is not non-compliance; only intake failures are.

Checks

Part A — Stability audit

A1 — One registry, complete (prevents: tariffs known only from speeches)
Check: Is every active and past measure in one public registry, with all fields?
How: Find the registry; compare it against the official gazette or customs schedule for the last 12 months.
MEETS: One registry; free, bulk download; all fields present; past states kept.
GAP: Measures found only in speeches or press releases; a gazetted measure missing from the registry; a field missing; a past state deleted.

A2 — Fits a pre-published category (prevents: a category written for the tariff)
Check: Was each measure classified under a category published at least 90 days before it, with comparable cases treated alike?
How: Compare each measure's announcement date with its category's publication date; compare 2 measures with similar evidence.
MEETS: Category published 90 days before; comparable cases alike, or the divergence explained in the decision record; rates within the category's bounds.
GAP: No categories published; a category published less than 90 days before; a measure unclassified; comparable cases treated differently without explanation; bounds exceeded or bypassed through "equivalent" measures; categories changed without a dated entry published 90 days ahead.

A3 — Stable 365 days (prevents: tariffs raised and lowered at will)
Check: Did each measure stay unchanged for at least 365 days?
How: Compare effective dates with modification dates.
MEETS: No change inside 365 days.
GAP: Any increase, reduction or removal inside 365 days, whatever the reason.

A4 — Announced 90 days ahead (prevents: overnight shocks)
Check: Was every new measure and modification announced at least 90 days before it took effect?
How: Compare announcement dates with effective dates.
MEETS: 90 days met; parameters and effective date included.
GAP: Shorter notice; "immediate effect".

A5 — Impact published with the announcement (prevents: costs nobody counted in time)
Check: Was the domestic impact analysis, with figures for consumer and business-input cost, published with the announcement?
How: Open the analysis linked from the registry entry; compare its date with the announcement date.
MEETS: Both costs in figures, published with the announcement, archived with the decision.
GAP: No analysis; costs without figures; analysis published after the announcement or after the effective date.

A6 — Decision traceable (prevents: a measure nobody authorized)
Check: Is the decision authority, date, category, scope and rationale recorded for every measure and modification?
How: Read the decision record from the registry entry.
MEETS: All recorded; the regional dispute mechanism field completed where it applies.
GAP: No named office; undated; a modification with no record.

Part B — Proposal channel

B1 — Proposals received and kept (prevents: a channel that exists only on paper)
Check: Does a proposal in the standard format receive a receipt and get registered, routed and preserved under D40?
How: Submit one, or review the intake log for submitted proposals.
MEETS: Receipt within D40 targets; registered, routed, preserved.
GAP: No intake point; no receipt; a proposal lost or deleted; a proposal refused for its content rather than its format.

Operational Note: review the Disclaimer (D53) before deployment.

Category 9: State Structure & Security

35. The Right to Surveillance Warnings [AUDIT EFFECT]

Extension ID: D32-R35-EXT

Entry
Specifies the **Surveillance Warning (SW)**: what it should disclose, where, and how an Owner tests it. These checks test the disclosure, not the product: a device with no physical off switch passes if it says so plainly, and a device that collects everything passes if it says that too. Nothing here bans a product, restricts a feature, or judges whether collection is justified.
SW = a short visible notice at purchase or activation stating surveillance or manipulation behavior and Owner control options.
Point of purchase/activation = package label, invoice, receipt, checkout screen, confirmation email, or first-run setup.
Surveillance/manipulation = capture, inference, transmission or profiling of audio, video, location, biometrics or behavior; or behavior limiting Owner agency — forced accounts, remote disablement, enforced restrictions.

Data specification
A compliant SW should be readable in ten seconds and contain:

#	Element	Content
1	Behavior	What happens on first launch, by default, continuously, without approval
2	Categories	Per category — audio, video, location, biometrics, behavioral telemetry, content access, network — yes or no
3	Remote power	Whether a non-Owner can access data, administer the device, push settings or disable it remotely: yes, no or unknown
4	Owner control	Physical off and single-switch software off: available or not, and what each disables
5	Components	Items 1–4 for the device or OS layer and for each preinstalled surveillance-relevant component — assistant, analytics, cloud sync, OEM apps, safety services
6	Status	Verified by a named party, self-attested, or unverified
7	Reference	Where fuller detail sits — a short pointer, not the terms themselves
8	Record	The same disclosure reproduced in a retrievable artefact: invoice, receipt or confirmation

Ten seconds because a warning that takes longer is read after the purchase decision, not before, which is the failure the right exists to prevent.

Regime requirements. The state requiring this sets: which product categories are in scope, the point of disclosure per category, the verification regime, and a compliance register. Absence of any of these is what a finding reports.

Evidence. A product observed without an SW evidences the absence of the regime, not a vendor defect. A finding cites the checkpoints failed across several products in the same category, with dates and where each was observed.

Checks

C1 — Present at the moment of purchase (prevents: disclosure that arrives after the decision)
Check: Does the SW appear on the package, invoice, checkout, confirmation or first-run screen, and is it reproduced in a retrievable artefact?
How: Buy or configure a product in the category; note where the disclosure first appears and whether it survives in the receipt or confirmation. Public unboxing photography and retailer listings settle most cases without a purchase.
MEETS: visible at or before purchase or activation, and retrievable afterwards.
GAP: reachable only from settings or help pages after purchase; present only in terms of service or a policy page; shown once with no record.

C2 — States what it does, not what it can do (prevents: capability language that discloses nothing)
Check: Is behavior written as does or defaults, rather than may or can?
How: Read the disclosure text.
MEETS: states default and background behavior in plain language.
GAP: describes capability only; hedged with may, can or similar; conditions the statement on settings the buyer has not yet seen.

C3 — Names what is collected and who else controls it (prevents: a complete-looking notice that omits the sensitive category)
Check: Is every collection category answered yes or no, and is remote power answered yes, no or unknown?
How: Compare the list against the eight elements above; any category left unmentioned is unanswered, not absent.
MEETS: every category explicitly answered; remote access, administration, forced updates and remote disablement each addressed.
GAP: any category omitted; a general statement in place of the list; remote power implied rather than stated.

C4 — Owner control disclosed with its scope (prevents: an off switch that turns off less than the buyer assumes)
Check: Are physical off and single-switch software off each stated as available or not, with what each disables?
How: Read the control section; compare the claimed scope against the component list in the same notice.
MEETS: both answered, with scope named — including an accurate "no physical off" or "camera only".
GAP: either unanswered; an off switch claimed with no scope; control described as available when the notice's own component list shows it is not.

C5 — Covers every component (prevents: an OS-level notice standing in for a dozen preinstalled systems)
Check: Are elements 1–4 present for each preinstalled surveillance-relevant component?
How: Compare the disclosure's component list against the preinstalled software the product ships with.
MEETS: each component covered in its own right.
GAP: OS or device layer only; components named without their own disclosure; a single notice covering all components without distinguishing them.

C6 — States its own standing (prevents: marketing language read as verification)
Check: Is the verification status named?
How: Read the status field.
MEETS: given as verified by a named party, self-attested, or unverified.
GAP: absent; implied by terms such as secure or private; verification claimed with no party named.

Operational Note: review the Disclaimer (D53) before deployment.

38. Voter Approval for Border Changes [AUDIT EFFECT]

Extension ID: D32-R38-EXT

Entry

Specifies the authorization a border change requires: what must be published, for how long, who votes, and the threshold. A border change is a contract-level rewrite: it changes which obligations an Owner carries, which law applies to them, what their Organization has committed them to, and which protections they can still rely on. It reaches the rest of their life and is not reversed by the next election.

These checks test whether the authorization happened as specified. They take no position on whether any border change is desirable, and none on any territory. Any failed check is an R38 failure; there is no partial result.

Where a border change has taken effect with no mandate, C8 fails and the change is recorded as non-compliant. The remaining checks do not apply, and a vote held afterwards does not cure the finding.

Border change = annexation, separation, or any administrative act that functionally changes which Organization governs a territory, however labelled.

Annexation = two jurisdictions merge, or one absorbs another.

Separation = a territory exits the Organization.

Reset = any material change to the published terms restarts the waiting period.

Data specification

Waiting period. Full terms published at least 365 days before the vote, with version history and dates. Reset applies.

Shorter waiting period, 180 days. Separation only, and only where one of two conditions is verified: the Organization has changed a border without a mandate meeting this standard, or it has started a war of choice. Reset still applies. Why 180: the exposure starts with the act, not with the vote. Casualties, liability and obligation accrue from the first day, and a waiting period that outlasts the thing it protects against is not a safeguard.

Owner-readable summary, published with the terms, covering: debt and tax, security and conflict exposure, citizenship and voting eligibility, governing law, and which steps are irreversible. Why: terms a reader cannot interpret are undisclosed in the only sense that matters.

Electorate. Definition and count published at the start of the waiting period and unchanged through it. Any change carries a dated entry and restarts the period.

Mandate — Double-Lock. Both required:

- YES votes above 50% of the total eligible electorate
- YES votes at or above 2/3 of ballots cast

Parties. Annexation: both jurisdictions vote, each meeting Double-Lock. Separation: the separating territory's electorate only; the Organization does not vote on it.

Integrity. The vote meets Right 13 and its extension.

Execution. The mandate precedes every step of the change. The change takes effect no earlier than 1 year after the mandate. Why: a mandate acted on long after it was given was not given for the circumstances in which it was used.

Retention and format. Proposal versions, electorate counts and results by polling district, retained 25 years. Free, no registration, bulk-downloadable.

What to produce

Filed under D40 with: right number and title; failed checkpoint ID; the change concerned; where looked for; retrieval date.

Label note: the substantive criterion sits in D31. These checks establish the facts it turns on.

Checks

C1 — Terms published in time (prevents: a vote on terms nobody could read)
Check: Full terms public 365 days before the vote, with every material change restarting the clock?
How: Compare first publication to vote date; compare versions for changes.
MEETS: 365 days met; each material change dated and the clock restarted.
GAP: period short; terms appearing late; a change relabeled minor to avoid reset.

C2 — Shorter period used only where it applies (prevents: 180 days as a shortcut)
Check: Where the vote came less than 365 days after publication, is it a separation, and is one of the two conditions verified?
How: Read the stated condition; check it against the record of the border change or the start of the war.
MEETS: separation, condition verified, at least 180 days between publication and vote, reset honored.
GAP: an annexation; no condition stated or none verified; under 180 days; reset ignored.

C3 — Consequences stated plainly (prevents: disclosure that discloses nothing)
Check: Does a plain-language summary cover all five headings?
How: Read it against the list.
MEETS: five headings present, in ordinary language.
GAP: a heading absent; technical texts only; irreversible steps unmarked.

C4 — Electorate fixed before the vote (prevents: an electorate assembled to produce a result)
Check: Definition and count published at the start and unchanged through the period?
How: Compare opening and closing counts and definitions.
MEETS: both published and unchanged, or changed with a dated entry and a restarted period.
GAP: definition altered late; mass registration without verification; counts unpublished or inconsistent.

C5 — Double-Lock met (prevents: a mandate from a minority)
Check: YES above 50% of eligible electorate, and at or above 2/3 of ballots cast?
How: Compute both from published results and the published electorate.
MEETS: both.
GAP: either; or results published without the electorate figure to compute against.

C6 — The right parties voted (prevents: one side deciding an annexation for two, or a separation decided outside the territory)
Check: Annexation — both jurisdictions, each meeting Double-Lock. Separation — the separating territory's electorate.
How: Compare the voting population to the jurisdictions affected.
MEETS: as specified.
GAP: one side only; partial regions; a territory's exit decided outside it.

C7 — The vote itself holds (prevents: a valid threshold reached by an invalid count)
Check: Does the vote meet Right 13 and its extension?
How: Run that checklist.
MEETS: it passes.
GAP: it does not, or cannot be assessed.

C8 — Authorized before executed (prevents: a change made first and a vote arranged after)
Check: Was the mandate obtained before any step of the change, and did the change take effect at least 1 year after the mandate?
How: Compare the implementation record to the vote date.
MEETS: mandate precedes every step; 1 year or more between mandate and effect.
GAP: administrative absorption, transfer of control, legal-system change or status change before the mandate — the change is unauthorized, and a later vote does not cure it; a temporary arrangement that cannot be reversed; effect under 1 year after the mandate.

Operational Note: review the Disclaimer (D53) before deployment.

39. Compensation Benchmark Transparency Safeguard [AUDIT EFFECT]

Extension ID: D32-R39-EXT

Entry

Specifies the compensation reference for high-stakes positions: its inputs, its calculation, and how an Owner tests whether references and actual pay are disclosed.

Why a published benchmark rather than a pay level. Singapore is the standard reference for competitive public-sector pay, and it is routinely misread as "pay more" — pay was one part of a package that also included independent investigation and asset declarations, and the published formula came decades after the results credited to it. What an Owner can test without a mandate is the disclosure: whether a benchmark exists, is published, and matches what is actually paid.

The reference is an audit benchmark, not a recommended schedule, and it expresses no view on any position or jurisdiction. These checks test disclosure and reconciliation. Pay away from the reference is recorded, never failed — the Organization retains full discretion over what it pays. The only failure is not publishing.

Reference levels sit well above typical public pay, deliberately: a head of government directs a budget larger than any corporation's, without a board or the option of exit, and is generally paid a fraction of an executive managing a hundredth as much. That gap is the exposure the benchmark measures. A finding that pay sits below reference is a measurement, not a demand.

Data specification

Scope. All state-related organizations, per D31 — but only for positions falling in the three tiers below. Positions outside them are out of scope.

Local Median Net Salary. Median net annual earnings of employees in the jurisdiction the position serves, from the national or regional statistics office. Median, not mean, because mean earnings track the top of the distribution rather than the typical earner. Net, after tax and mandatory contributions, because the comparison is to what an Owner takes home. Where no median is published, the mean from the same source is used and named as such.

Population. The jurisdiction's official resident count, from the most recent published census or register, with its date.

Position factors.

Tier	Positions	Factor
1	President, head of government, cabinet ministers; heads of police, military, intelligence, revenue; supreme court members; head of the electoral commission	8×
2	Members of parliament, congress or senate; the top three deputy roles in police, military, intelligence, revenue	4×
3	Heads of municipal councils, populations above 5,000	3×

Scale factors.

Population	Factor
>= 100 million	5×
>= 10 million	4×
>= 1 million	3×
>= 100,000	2×
Below 100,000	1×

Fields per publication. Period; organization; position title and tier; the median used, with source, territory and publication date; population and its source date; position factor; scale factor; resulting reference; actual total compensation for the position, with its components — base, allowances, housing, vehicle, pension accrual, severance entitlement; the difference between actual pay and reference.
Cadence. Annual, aligned to the budget cycle. Newest publication under 12 months old, since a reference built on a superseded median describes a pay structure that no longer exists.
Retention. Ten years, so pay drift can be read against the median it was benchmarked to. Corrections appear as dated entries, not silent edits.
Format. Free, no registration, searchable, downloadable in bulk.

Calculation

Reference = Local Median Net Salary × Position Factor × Scale Factor.
One figure per position.
Example — president, population 70 million. Scale 4×, position 8× → **32×** the national median net salary.
Example — head of a municipal council, population 200,000. Scale 2×, position 3× → **6×** the local median net salary.

Checks

C1 — Compensation published per position (prevents: pay visible only as an aggregate payroll line)
Check: Is total compensation published for each in-scope position, itemized by component?
How: Budget documents, transparency portal, open-data catalogue, statutory salary register.
MEETS: each position named with its total and components.
GAP: aggregate payroll only; base salary alone, omitting allowances, housing, vehicle or pension accrual; some tiers published, others not.

C2 — Reference published with its inputs (prevents: a figure no one can recompute)
Check: Are the median, population, position factor and scale factor published alongside the reference?
How: Read the publication; confirm each cited source is retrievable.
MEETS: all four present; median named as median or mean, with source, territory and date; population dated.
GAP: reference without inputs; median unsourced or territory unstated; median and mean not distinguished; population undated.

C3 — Current and maintained (prevents: a reference benchmarked to a median that has since moved)
Check: Is the newest publication under 12 months old, with prior years accessible?
How: Compare the period covered to today; check earlier editions remain retrievable.
MEETS: within 12 months; ten-year series intact; corrections dated.
GAP: older than 12 months; gaps in the series; prior figures altered without notice.

C4 — Reference and actual pay reconcile (prevents: a published reference with no stated relation to what is paid)
Check: Does recomputation reproduce the reference, and is the difference from actual pay stated?
How: Recompute from the published inputs and compare.
MEETS: recomputation matches; difference stated and quantified. Any difference passes provided it is stated.
GAP: recomputation does not match; difference not stated; reference published with no actual figure to compare.

Operational Note: review the Disclaimer (D53) before deployment.
